

## INSTRUCTIONS FOR RESIDENTS ITUGRAF

The Finnish ItuGraf® panel system works independently, guaranteeing a pleasantly even temperature in the apartment without dust, draft or sound. With the heating and cooling toggle switch, the resident can choose either heating or cooling for the apartment. The system responds quickly to the need for heating or cooling.

In the living areas, a thermostat mounted on the wall measures the room temperature, and adjusts the temperature to remain at the selected value from the handwheel. In humid rooms, a free-circulation system is usually used, so that the temperatures remain suitable with the heat generator's own automation.

### To achieve the best benefit and and even temperature:

- Do not cover the thermostat with curtains or furniture.
- Change the setpoints in the desired direction only slightly at a time, and wait a few hours for the change to take effect.

### Consideration:

- The upper and / or lower limit of the thermostat handwheel may be locked, so that the thermostat only operates within the permitted range.
- If the room temperature is constantly too high or low and the position of the thermostat has no effect, it is advisable to contact a service company. Always check the accuracy of your own thermometer first.
