Product Description

The ItuGraf® panel is made of thermally conductive graphite with an embedded copper meander 10 millimeters in diameter. The panel's casing is formed from galvanized sheet steel and is available with a smooth or perforated surface. The panels can be painted using RAL colors (the standard color is RAL 9016). The panels can also be fitted with insulation on the top surface.

The ItuGraf standard sail module in free hanging installation is the most efficient in spot heating and cooling cases. The standard panel with one copper meander can be used in combination with a change-over system using e.g. a 6-port valve to allow for heating or cooling. Itula provides also panels in 2-circuit version with two totally independent cooling and heating networks working in parallel, without any risk of fluid mixing in the panel. The patented one layer graphite activation system makes sure that both circuits give the maximum possible output.

The thermal transfer rate of ItuGraf panels is optimized to provide maximum heating and/or cooling. The cooling capacity at $\Delta T=10$ K: average temperature of supply/return water - the desired room temperature) is 125 W/m² (insulated) and 160 W/m² (non-insulated) per active area of the panel. The cooling capacity is achieved with a turbulent flow in the panel's pipe. This usually leads to a temperature difference of between two and three degrees on the water side.

The standard widths of ItuGraf panels are 595 mm, 895 mm and 1190 mm. The standard lengths are 590 mm, 1190 mm, 1790 mm, 2390 mm, 2990 mm and 3590 mm. Panels are made to measure sizes upon request. The panels can be hung from the ceiling by adjustable cable wire mounting sets. For panels with a width of 595 mm, 895 mm and 1190 mm the patented surface bracket can also be used for installation. ItuGraf panels are CE marked and a Declaration of Performance is available upon request.

Project with Itula

1. Design

2. Positioning & Drawings

3. Production

4. Delivery Phase

5. Installation

The products are selected according to the customer's HVAC technical and architectural plan. Itula has developed ItuCalc design tool, which is used to calculate the number of panels required and the appropriate connection and installation method are selected based on the floor plan of the object. After the design phase, production drawings of the products are sent for customer approval. Drawings acceptance ensures that the right kind of products are ordered on site. ItuCalc design tool is available free of charge. [Read more from here.](#)

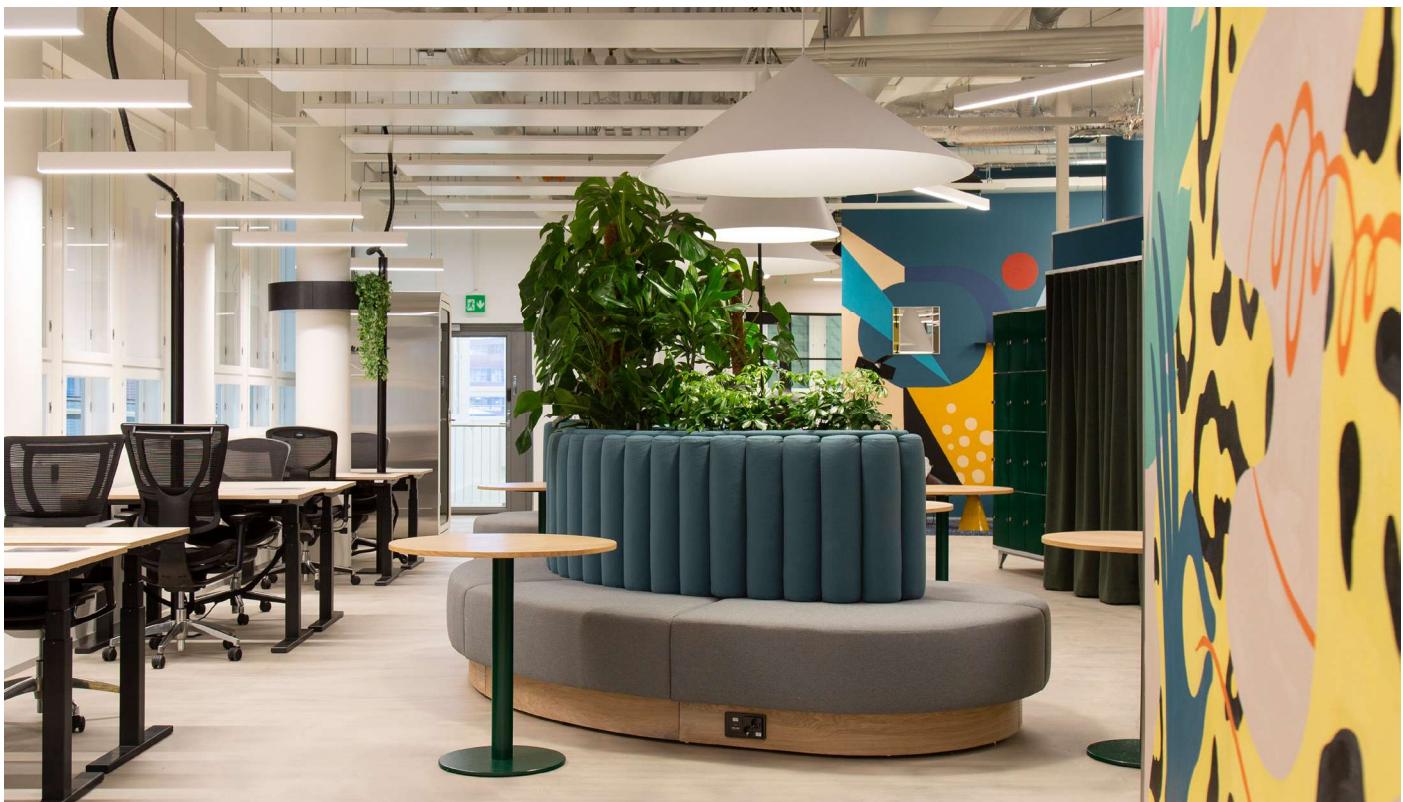

In the delivery phase products are packaged into right size lots is made according to customer specification and transported to the worksite. Itula has experience in a variety of installation methods and customer specified products please contact your local sales to find out how we can suit the needs of your project.

Environment & Sustainability

Itula Oy has sought to reduce losses and the amount of waste generated in production. The aim is to utilize all the pallets and packaging materials of the parts and materials coming into production in the packaging of the outgoing products, thus avoiding unnecessary procurement of packaging materials and the generation of packaging waste. ItuGraf radiant ceiling panels are made with materials with high recyclability rate.

Style and Architecture

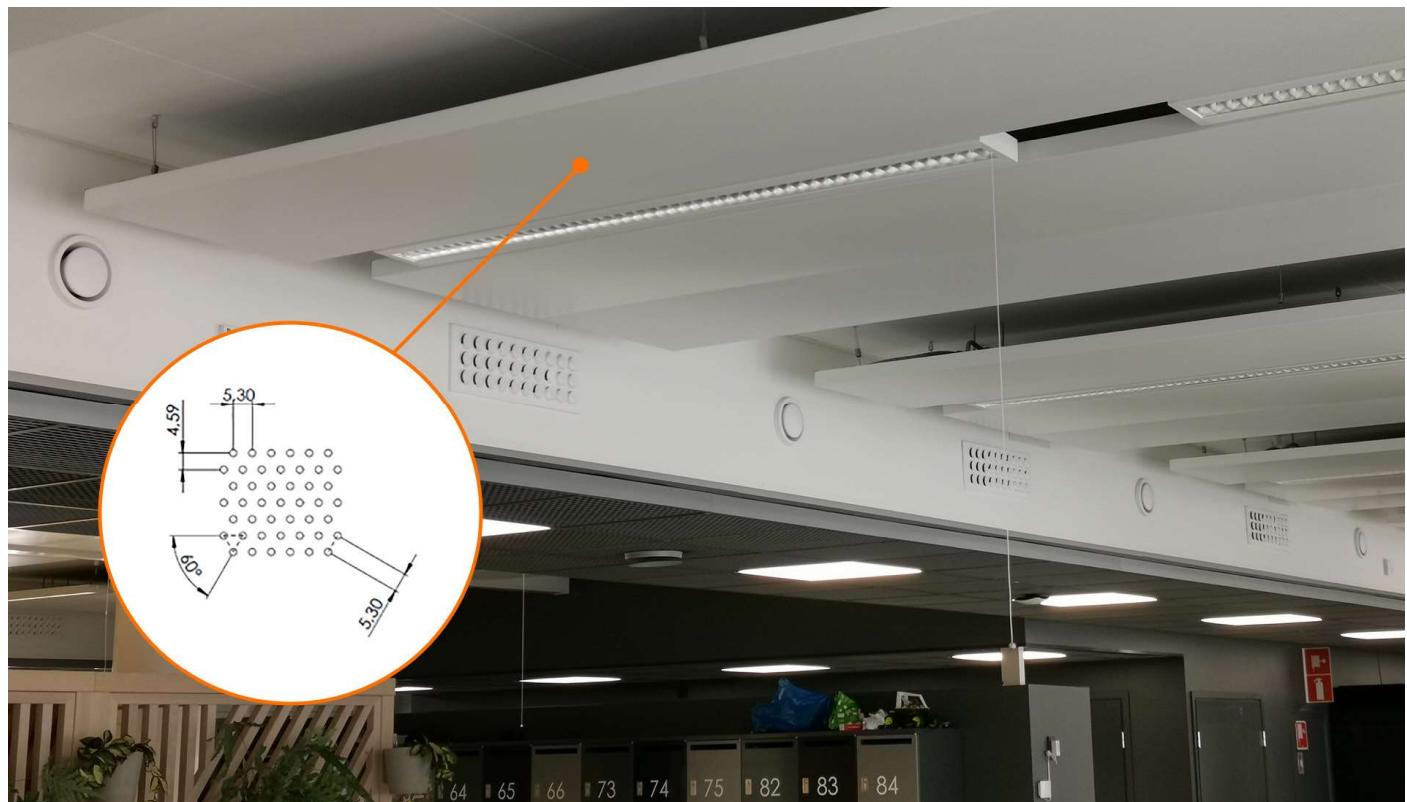

Itula's suspended ceiling collection currently extends to the product families of Saint-Gobain Ecophon and Rockfon acoustic T24 ceiling systems. The suitable Ecophon models are the A, Dg, Ds, E and Lp edge models in the Focus range and the A, Ds and E edge models in the Master range. ItuGraf panels match the Rockfon ceiling systems' edge models A, E, M, X and Z. ItuGraf ceiling panels are suitable for a 600-mm wide grid.

ItuGraf ceiling models allow the design of a space based on its architecture. The design has been based on the premise that the whole of the panels and suspended ceiling panels would be as harmonious as possible so that the panels integrate seamlessly into the selected suspended ceiling system. ItuGraf panels can be customized in numerous ways to suit different spaces. There are various size, color, and surface options as well as device integrations available.

Panels can be powder coated into the color specified in the project. The standard color of the Itula panels is RAL9016. The integration of lighting into the panels reduces the amount of installation work on site. Technology integrations also reduce on-site losses and breakages. Site logistics will improve when there are fewer component deliveries and suppliers. Security of supply is improved by getting a factory prepared set on site ready for installation.

Acoustics

The combination of radiant cooling and heating panels with acoustic ceilings is a good idea to improve the acoustics and sound attenuation of a room. The combination of ItuGraf suspended ceiling models and acoustic tile surfaces makes possible to highlight or hide the heating and cooling panels of the ceiling.

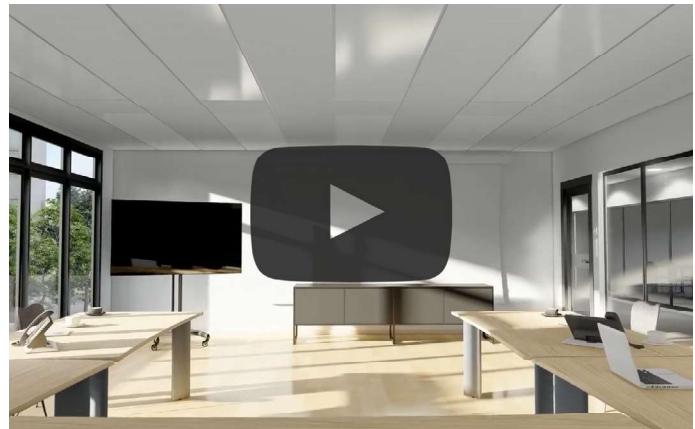

ItuGraf panels can be ordered as acoustic version where the panel is perforated and equipped with acoustic inlay improving the sound absorption values. Our standard perforation specification is full perforation Ø2.00 T5.30 (13 %) according to above pattern detail. Acoustic values depend on the installation method and above insulation.

For acoustical performance information please contact our sales for more details.

ItuGraf Ecophon Ceiling Models

The Finnish ItuGraf® radiant ceiling heating and cooling system can be customised to suit a range of settings. Together with Saint-Gobain Rakennustuotteet Oy, Itula has developed a range of ItuAlu® panel models that perfectly match the Ecophon modular ceiling systems.

The ItuGraf® ceiling models are made to match the A, Dg, Ds, E and Lp edges in the Saint Gobain Ecophon T24 Focus range and the A, Ds and E edges in the T24 Master range. ItuGraf® suspended ceiling panels are suitable for a 600 mm wide suspended ceiling grid.

ItuGraf Model A

ItuGraf® Model A integrates with the A edge in the Focus and Master ceiling systems. The A edge has a visible grid and easily demountable tiles. Unlike with the other edges, the ItuGraf® Model A ceiling can be used with the T24 grid and also with the T15 grid.

ItuGraf Model DG

ItuGraf® Model Dg has been designed to match the Dg edge in the Focus range. The Dg edge design has concealed support edges to create a distinctive floating appearance. The suspension grid is approximately 14 mm above the visible surface of the tile, which gives the impression that each tile is individually suspended. All of the tiles are easily demountable.

ItuGraf Model DS

ItuGraf® Model Ds can be used with the Ds edge in the Focus and Master ranges. The Ds edge is suitable for applications where a suspended ceiling with a concealed grid is required. The tiles have a symmetrical edge design. The ceiling has an even appearance, with the bevelled edges forming a discreet groove between the tiles. The tiles are easily demountable.

ItuGraf Model Lp

ItuGraf® Model Lp fits together with the Lp edge in the Focus range. The Lp edge semi-concealed grid system can be used for highlighting direction in a room. The longer sides have a wide gap between the tiles while the tile connections on the shorter sides are concealed.

ItuGraf Model E

ItuGraf® Model E has been designed to match the E edge in the Focus and Master ranges. The E edge has a recessed visible grid, creating a ceiling with a shadow effect. The visible surface of each tile is 10 mm below the grid. All of the tiles are easily demountable.

ItuGraf Rockfon Ceiling Models

The Finnish ItuGraf® radiant ceiling heating and cooling system can be customised to suit a range of settings. Together with Rockfon, the provider of acoustic ceiling and wall systems, Itula has developed a range of ItuGraf panel models that perfectly match the Rockfon modular ceiling systems.

The ItuGraf® ceiling models are made to match the A24, A15, E24, M, X and Z edges. ItuGraf® ceiling models are suitable for a 600 mm wide suspended ceiling grid.

ItuGraf Model A

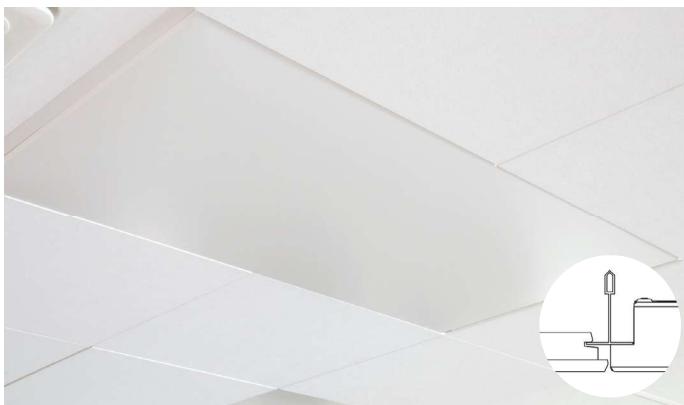

ItuGraf® Model A integrates with the A24 and A15 edge system. The A edge has a visible grid and easily demountable tiles.

ItuGraf Model M

ItuGraf® Model M has been designed to match the M edge. The M edge design has concealed support edges to create a distinctive floating appearance. The suspension grid is approximately 14 mm above the visible surface of the tile, which gives the impression that each tile is individually suspended. All of the tiles are easily demountable.

ItuGraf Model X

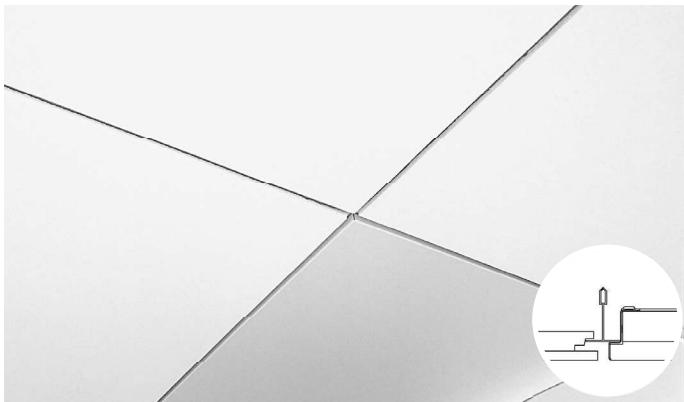

ItuGraf® Model X can be used with the X edge. The X edge is suitable for applications where a suspended ceiling with a concealed grid is required. The tiles have a symmetrical edge design. The ceiling has an even appearance, with the bevelled edges forming a discreet groove between the tiles. The tiles are easily demountable.

ItuGraf Model E

ItuGraf® Model E has been designed to match the E24 edge. The E edge has a recessed visible grid, creating a ceiling with a shadow effect. The visible surface of each tile is 10 mm below the grid.

ItuGraf Model Z

ItuGraf® Model Z fits together with the Z edge in the Rockfon range. The Z edge semi-concealed grid system can be used for highlighting direction in a room. The Z model is used when the T-bar system is designed for a sleek linear look that emphasizes the geometric directional effect of a room.

Maximum operating temperature	°C	Smooth 83 / Perforated 55																	
Maximum operating pressure	bar	8																	
Options		Perforation, special colours, cut-outs, integration of building components, insulation																	

Dimensioning and System Design

The heating output of the radiant ceiling panel is distributed in the room as natural convection and radiation. Natural convection accounts for about 25% and radiation for about 75% of total heating output. The supply water temperature for heating radiant ceiling panel can be 30–55 °C and the temperature drop 3–10 °C. Radiant heating is most often designed for supply water temperature between 40 and 45 °C and a room temperature of 21 °C.

During cooling, the radiant ceiling panel receives heat from the room. The total cooling capacity is about 40 % from natural convection and about 60 % from radiation. The supply water temperature for radiant cooling can be 14–17 °C and temperature rise can be approximately 2–3 °C. Radiant cooling is most often designed for supply water temperature 15 °C and a room temperature between 25–26 °C.

Most of the energy sources on the market are suitable for radiant ceiling panels. For example, heat pumps can be used, which take their energy from the ground, air or water. The term coefficient of performance (COP) describes the efficiency of a heat pump. The low supply water temperature of the radiant ceiling panels during the heating season and the high supply water temperature during the cooling season help to increase the efficiency of the heat pumps, in other words the COP figure. The higher the COP figure, the more energy efficient the building's radiant heating and cooling system.

The aim of design for the radiant heating and cooling system are that the flow of one radiant ceiling panel should be between 72-90 l/h. The radiant ceiling panel size 595 mm x 2990 mm produces a pressure drop of about 4 to 6 kPa at flows of 72-90 l/h. Radiant ceiling panels can be connected to the water supply with flexible hoses. One end of the flexible hose has a 10 mm push-fitting connector for the radiant panel and the other end has a ½" connector with an external thread for the main pipe connection. The most common flexible hose lengths are 0.5 m, 0.8 m, and 1.5 m.

Radiant ceiling panels can be installed in series with a maximum of 2-5 pieces depending on pressure drop, flow rates and output requirements. The panels connected in series can be connected to each other with flexible hoses with 10 mm push-fitting connector at both ends.

The radiant ceiling panels mounted in parallel can be connected in two different ways, with- or without reverse return. When connected without reverse return, lockshield valves are installed in the return side of each radiant ceiling panel to ensure the correct flow for each panel.

In reverse return, the idea is to provide the same length of supply and return water pipes for one group of radiant ceiling panels, so that the pressure losses on the supply and return side are equal. In one radiant ceiling panel group, the circulating water is evenly distributed to all panels, eliminating the need for lockshield valves. This reverse return connection method, called also as Tichelmann loop-connection, needs no additional balancing between the panels in a panel group when all the panels have the same size.

The flow of the radiant ceiling panel groups can be adjusted to be correct by using pressure independent balancing and control valves with actuator or radiant panel valves with actuator.

The radiant ceiling panel group is controlled by means of a thermostat in the room. Several radiant ceiling panel groups can be installed behind one thermostat. The thermostat controls the actuator, which opens and closes according to the thermostat setup.

In humid climates, condensation on the radiant ceiling panel surface during cooling have to be avoided. To prevent condensation on the panel, the flow temperature should be adjusted according to the dew point. The dew point sensor is installed on the supply water pipe, and the controller calculates the dew point temperature considering the specific room air conditions at the measured supply water temperature. Thanks to the dew point monitor, the flow value always remains at least one degree higher than the dew point temperature in the room.

ItuGraf Heating & Cooling Outputs

Module width 600 - Output in free hanging installations

The following tables show the heating output and cooling capacity for open ceiling installation according to EN 14037-2/3 (heating) and EN 14240 (cooling).

$$\Delta t = \left(\frac{t_1 + t_2}{2} \right) - t_i$$

t_1 = Inlet Water Temperature °C
 t_2 = Outlet Water Temperature °C
 t_i = Indoor Temperature °C

Module width 900 - Output in free hanging installations

The following tables show the heating output and cooling capacity for open ceiling installation according to EN 14037-2/3 (heating) and EN 14240 (cooling).

$$\Delta t = \left(\frac{t_1 + t_2}{2} \right) - t_i$$

t_1 = Inlet Water Temperature °C
 t_2 = Outlet Water Temperature °C
 t_i = Indoor Temperature °C

Module width 1200 - Output in free hanging installations

The following tables show the heating output and cooling capacity for open ceiling installation according to EN 14037-2/3 (heating) and EN 14240 (cooling).

$$\Delta t = \left(\frac{t_1 + t_2}{2} \right) - t_i$$

t_1 = Inlet Water Temperature °C
 t_2 = Outlet Water Temperature °C
 t_i = Indoor Temperature °C

Pressure Loss & Minimum Flow

The following diagram represents the minimum mass flow in 10 mm pipe in order to achieve turbulent flow. A turbulent flow must be ensured within the pipes to obtain the rated output. This minimum mass flow depends on the lowest system temperature. When heating, this corresponds to the return temperature. When cooling, this corresponds to the supply water temperature. Maximum accepted flow speed in the pipe is 0.8 m/s.

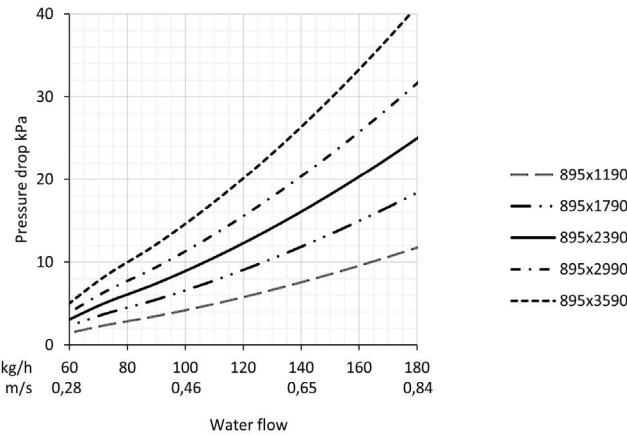

15 °C water

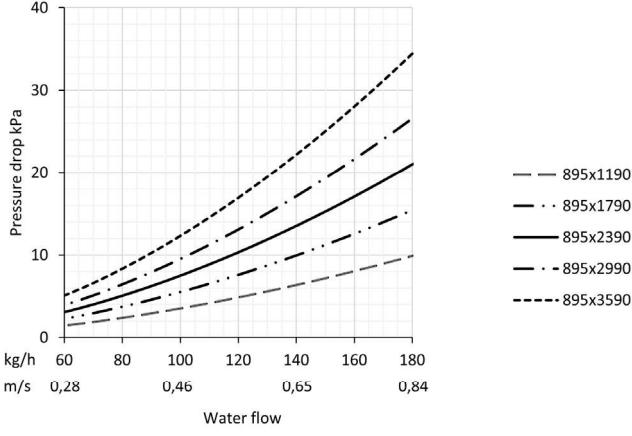

55 °C water

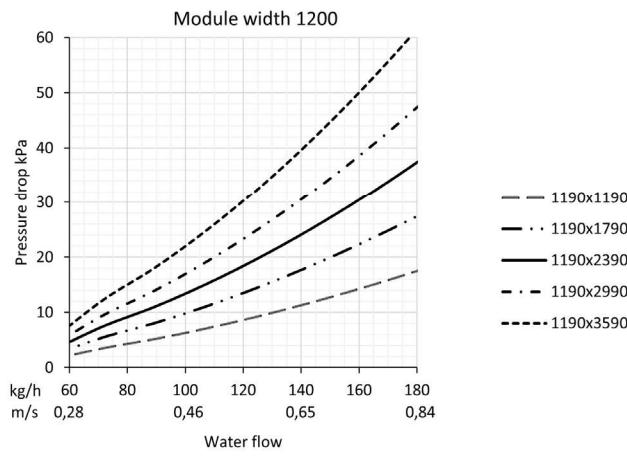

Module width 900

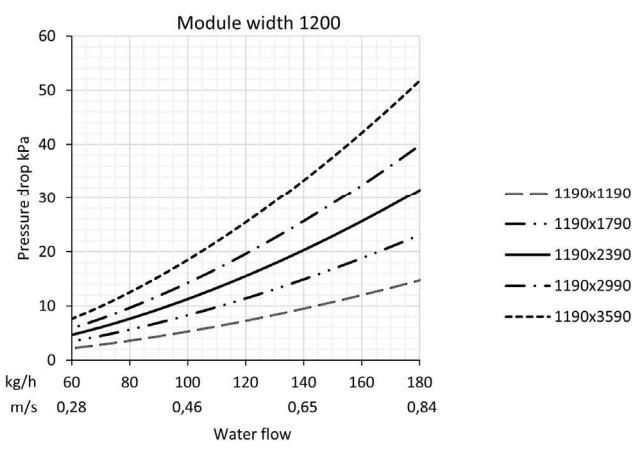

Module width 900

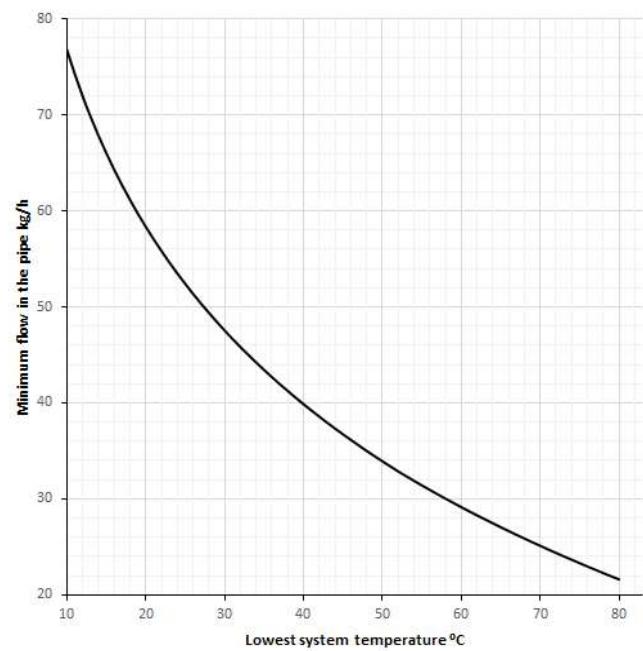

Module width 1200

Module width 1200

Minimum flow rate for turbulent flow

ItuCalc Calculation Tool

The ItuCalc design tool makes it quick and easy to calculate the heating and cooling outputs of ItuGraf and ItuString+ panels.

Itula has developed a comprehensive calculation tool for projects with radiant heating and cooling panel solutions. The tool can be used for heating and cooling output calculation for Itula products as well for hydraulics calculations. It includes the specifics of standards visually for the designer for easy use. The calculation tool also provides the product codes to be included in the HVAC drawings so that the chain from design into production stays clear and transparent.

Fixing Options with Cable Wires

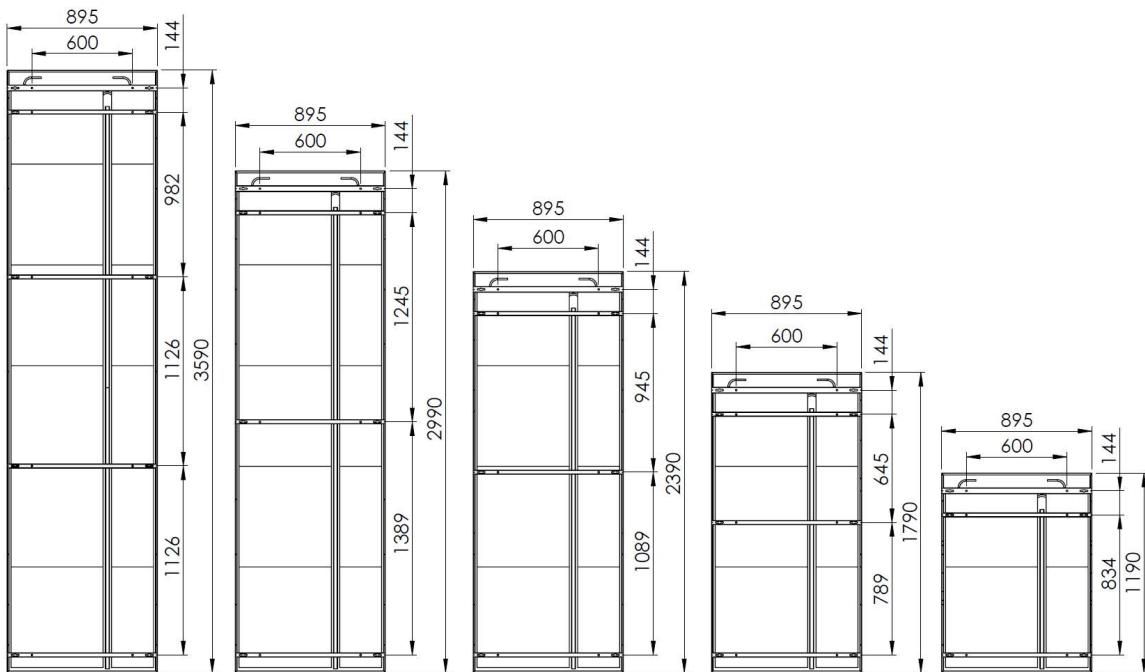

Mounting locations for ItuGraf panels

The following figures and tables show the number and positioning of the fixing points for panels with widths of 595 mm, 895 mm and 1190 mm. Wires or threaded rods can be used to fix the panels into the ceiling through holes located in the fixing points.

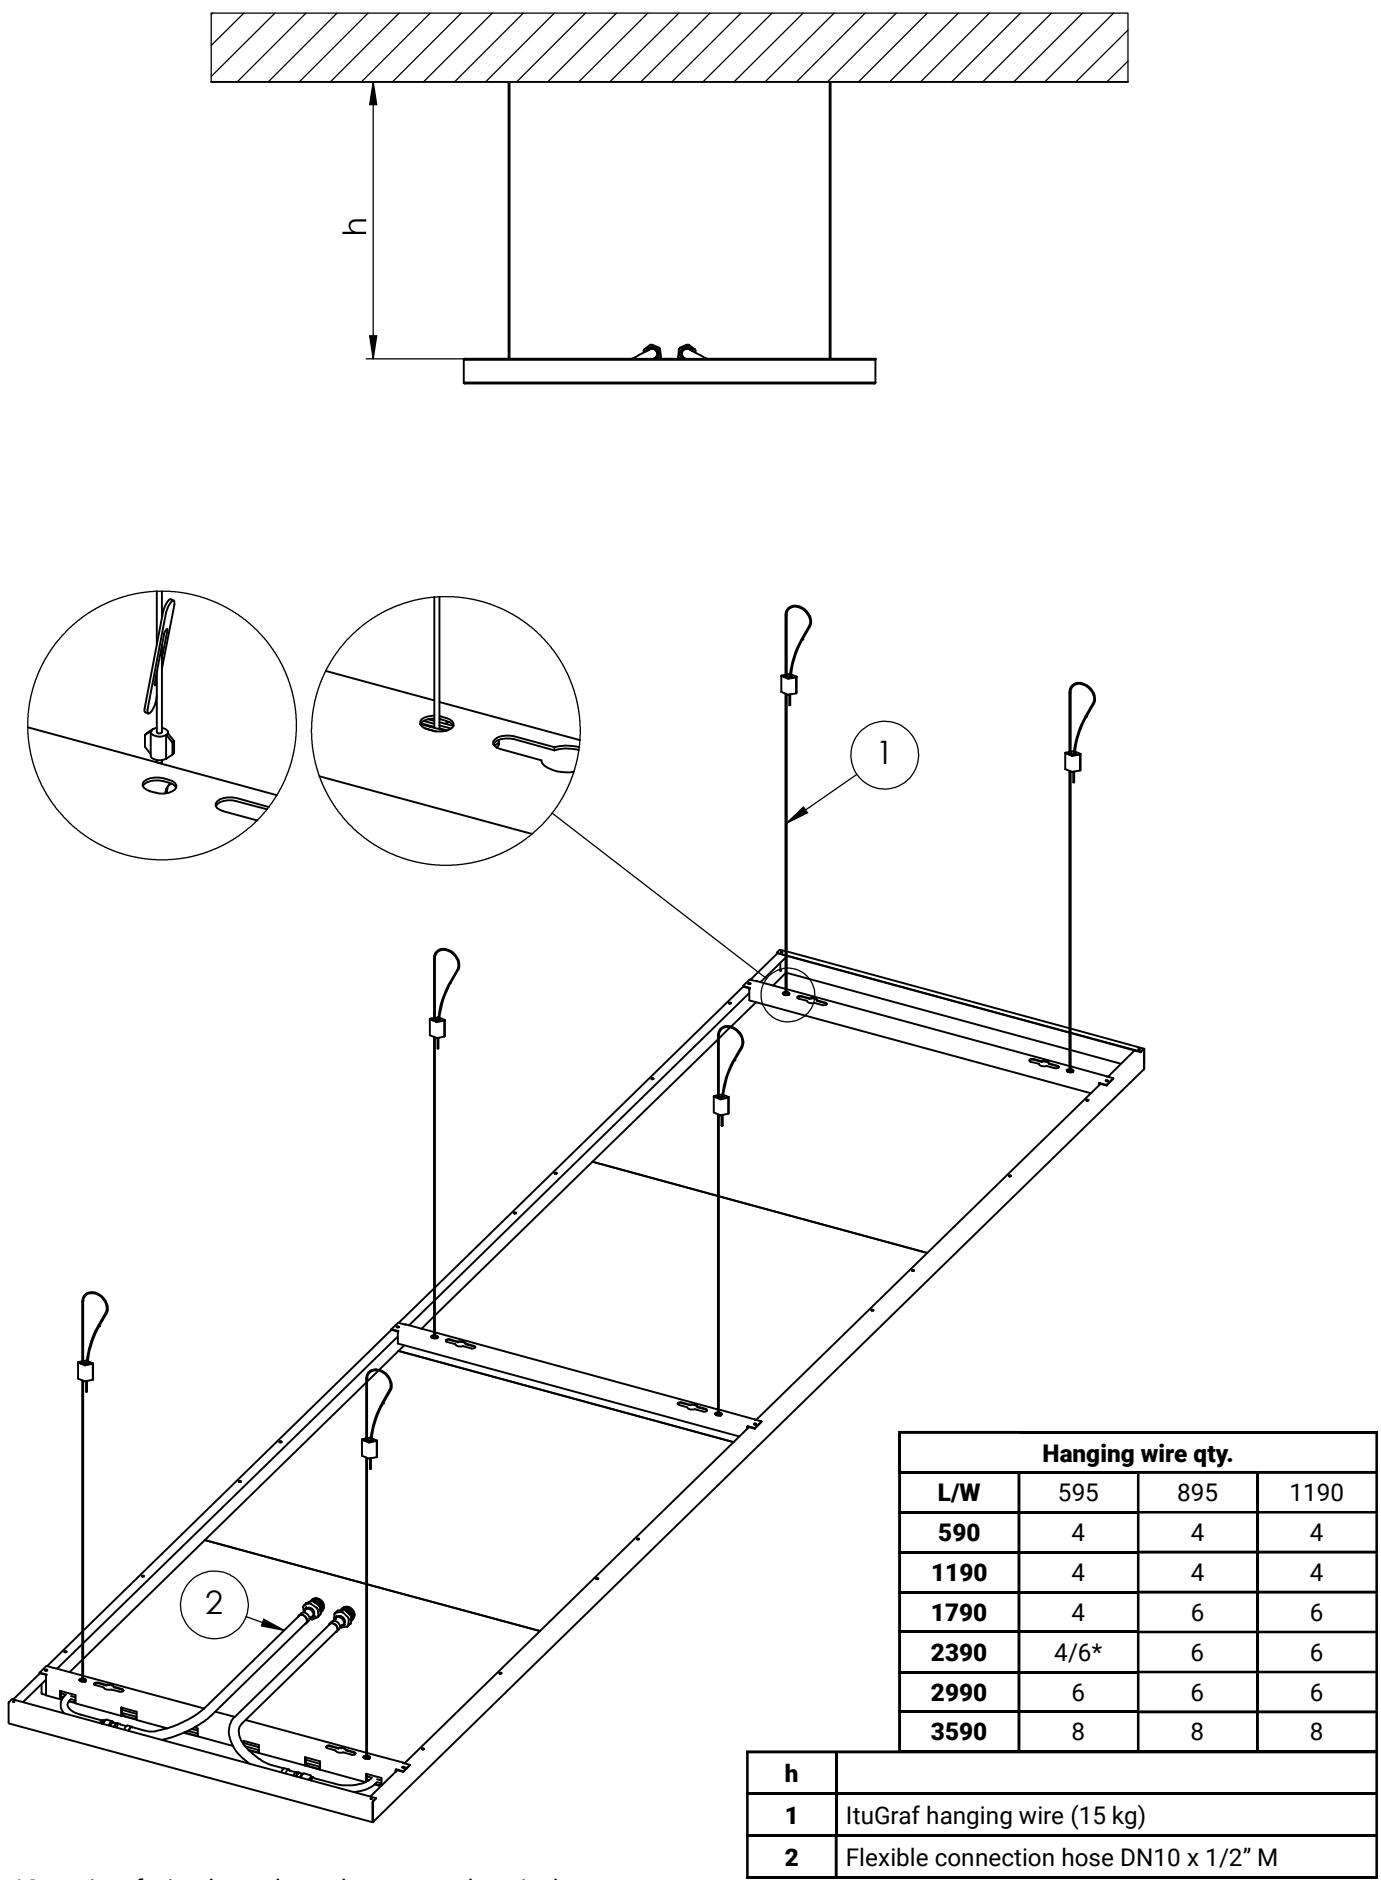

Panel width: 595mm

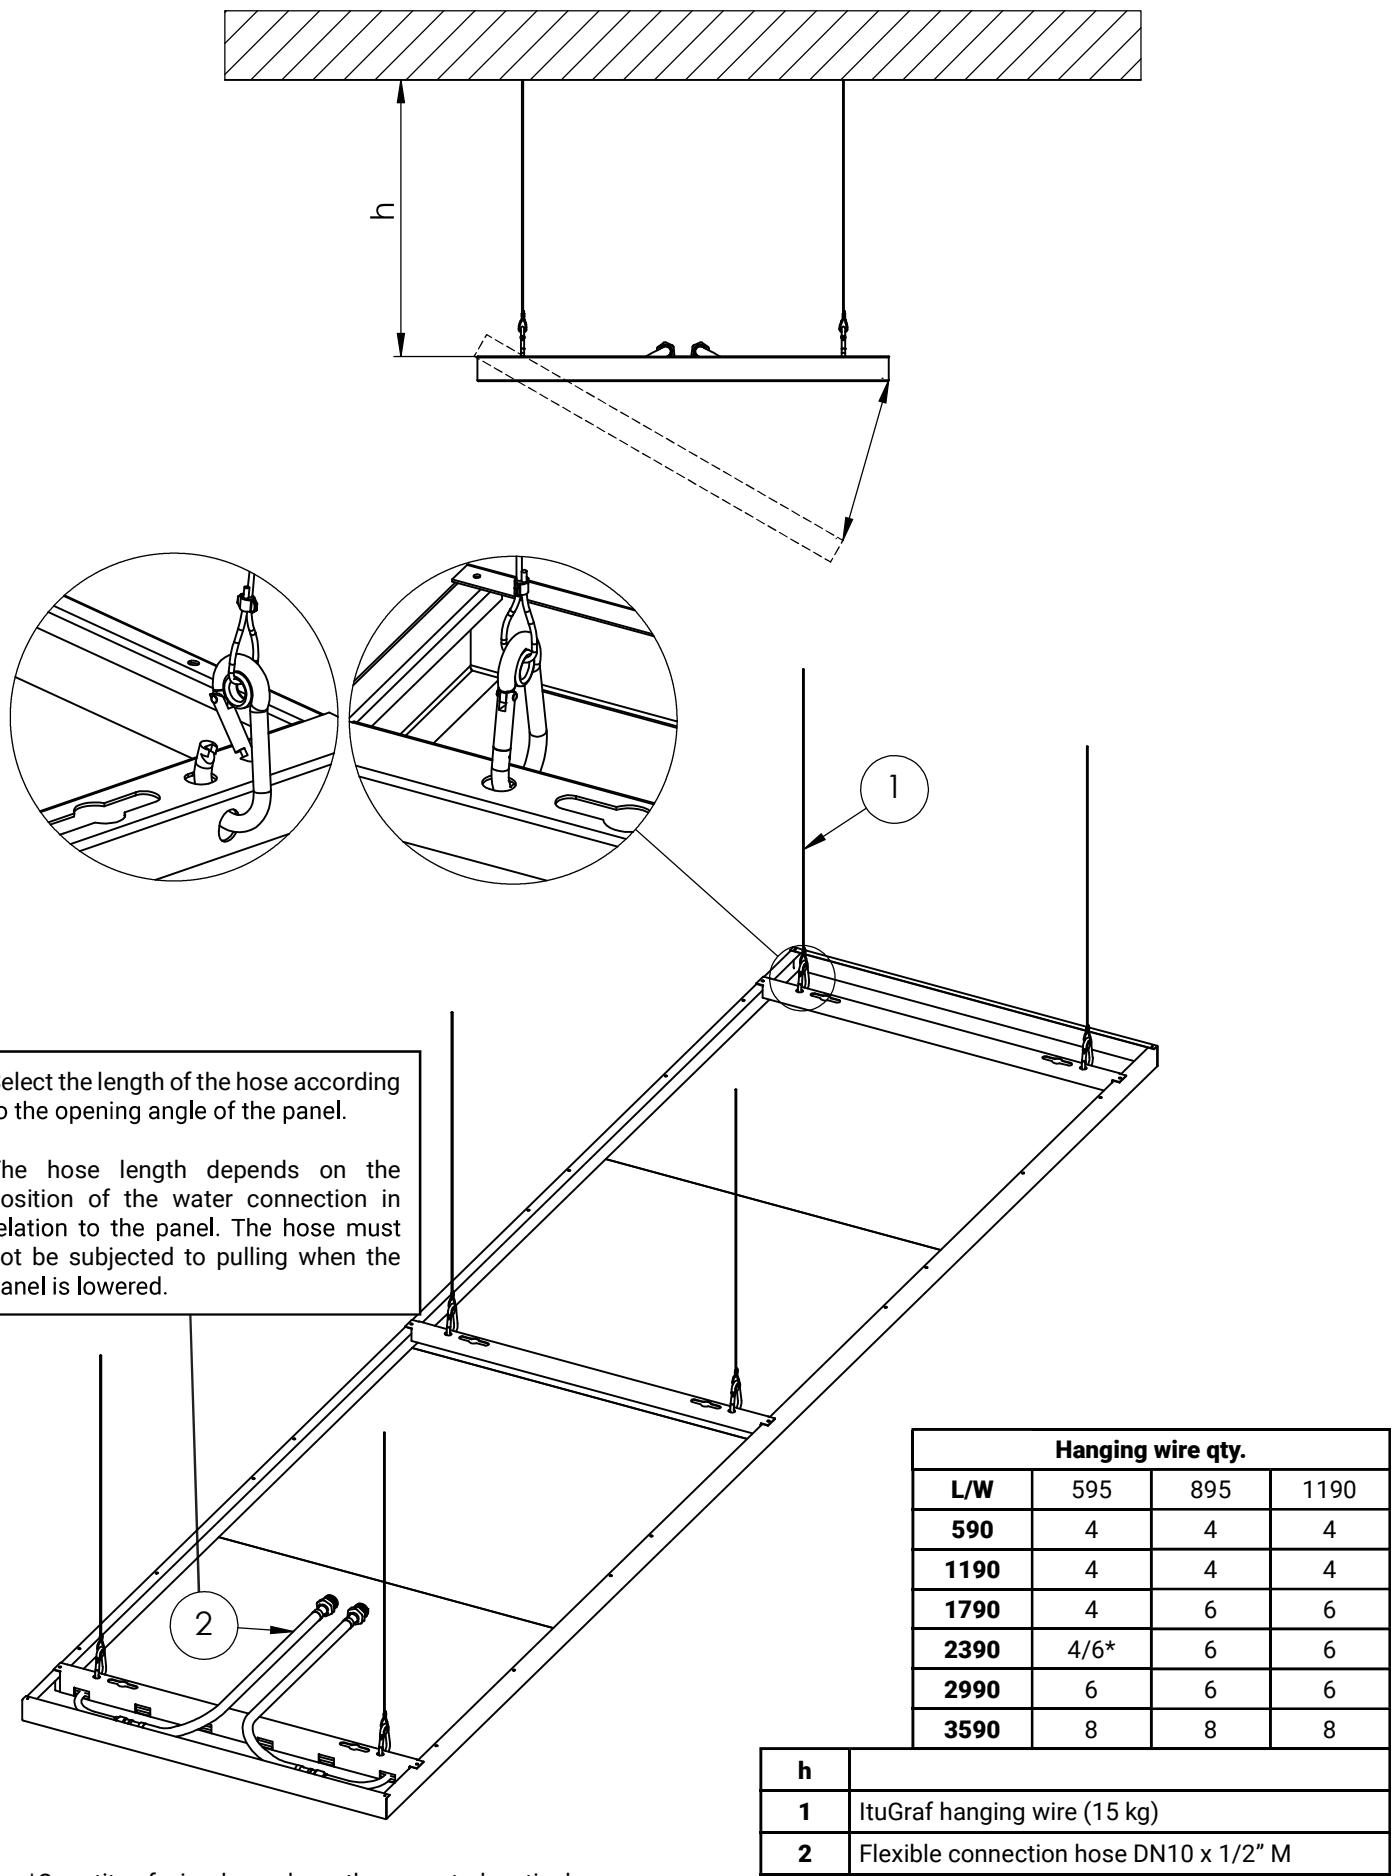

Panel width: 895mm

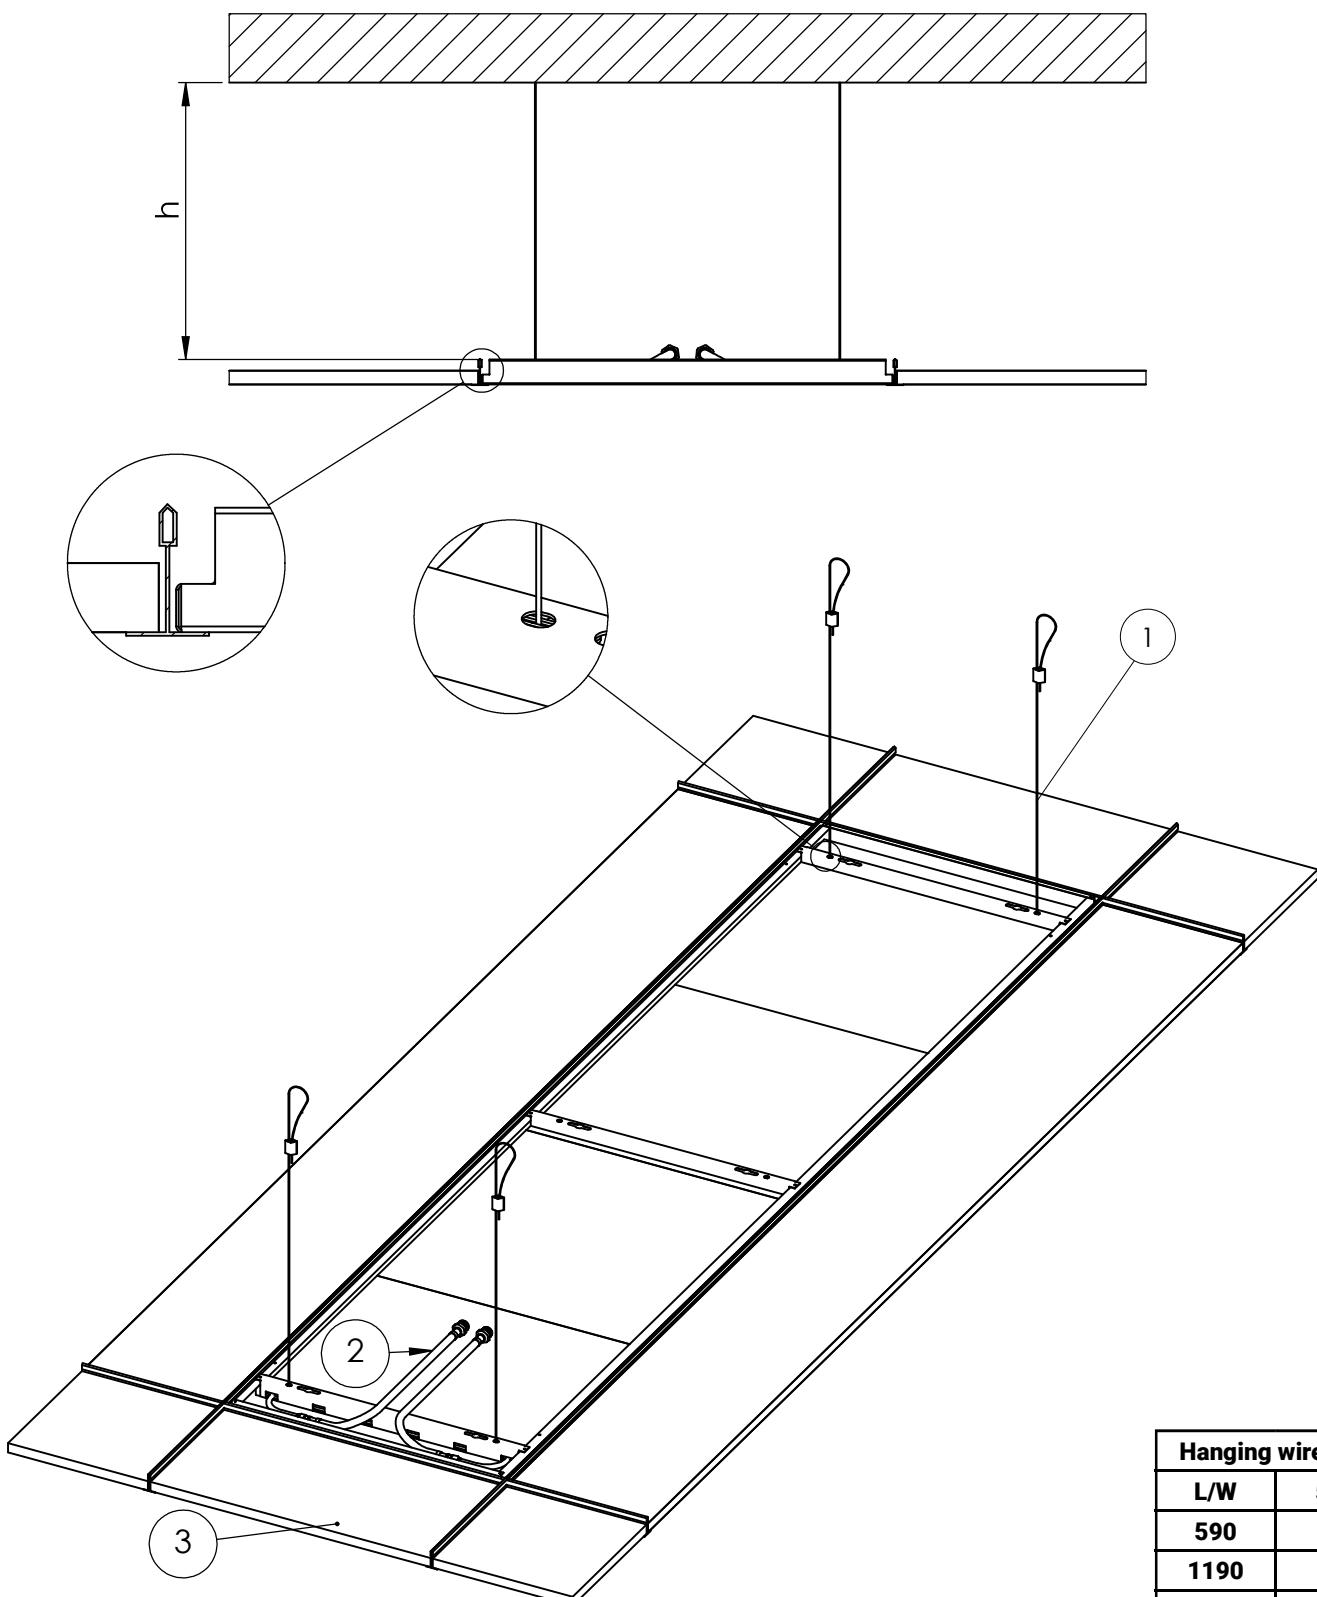

Panel width: 1190mm

*Quantity of wire depends on the accepted vertical deflection/sagging on site.

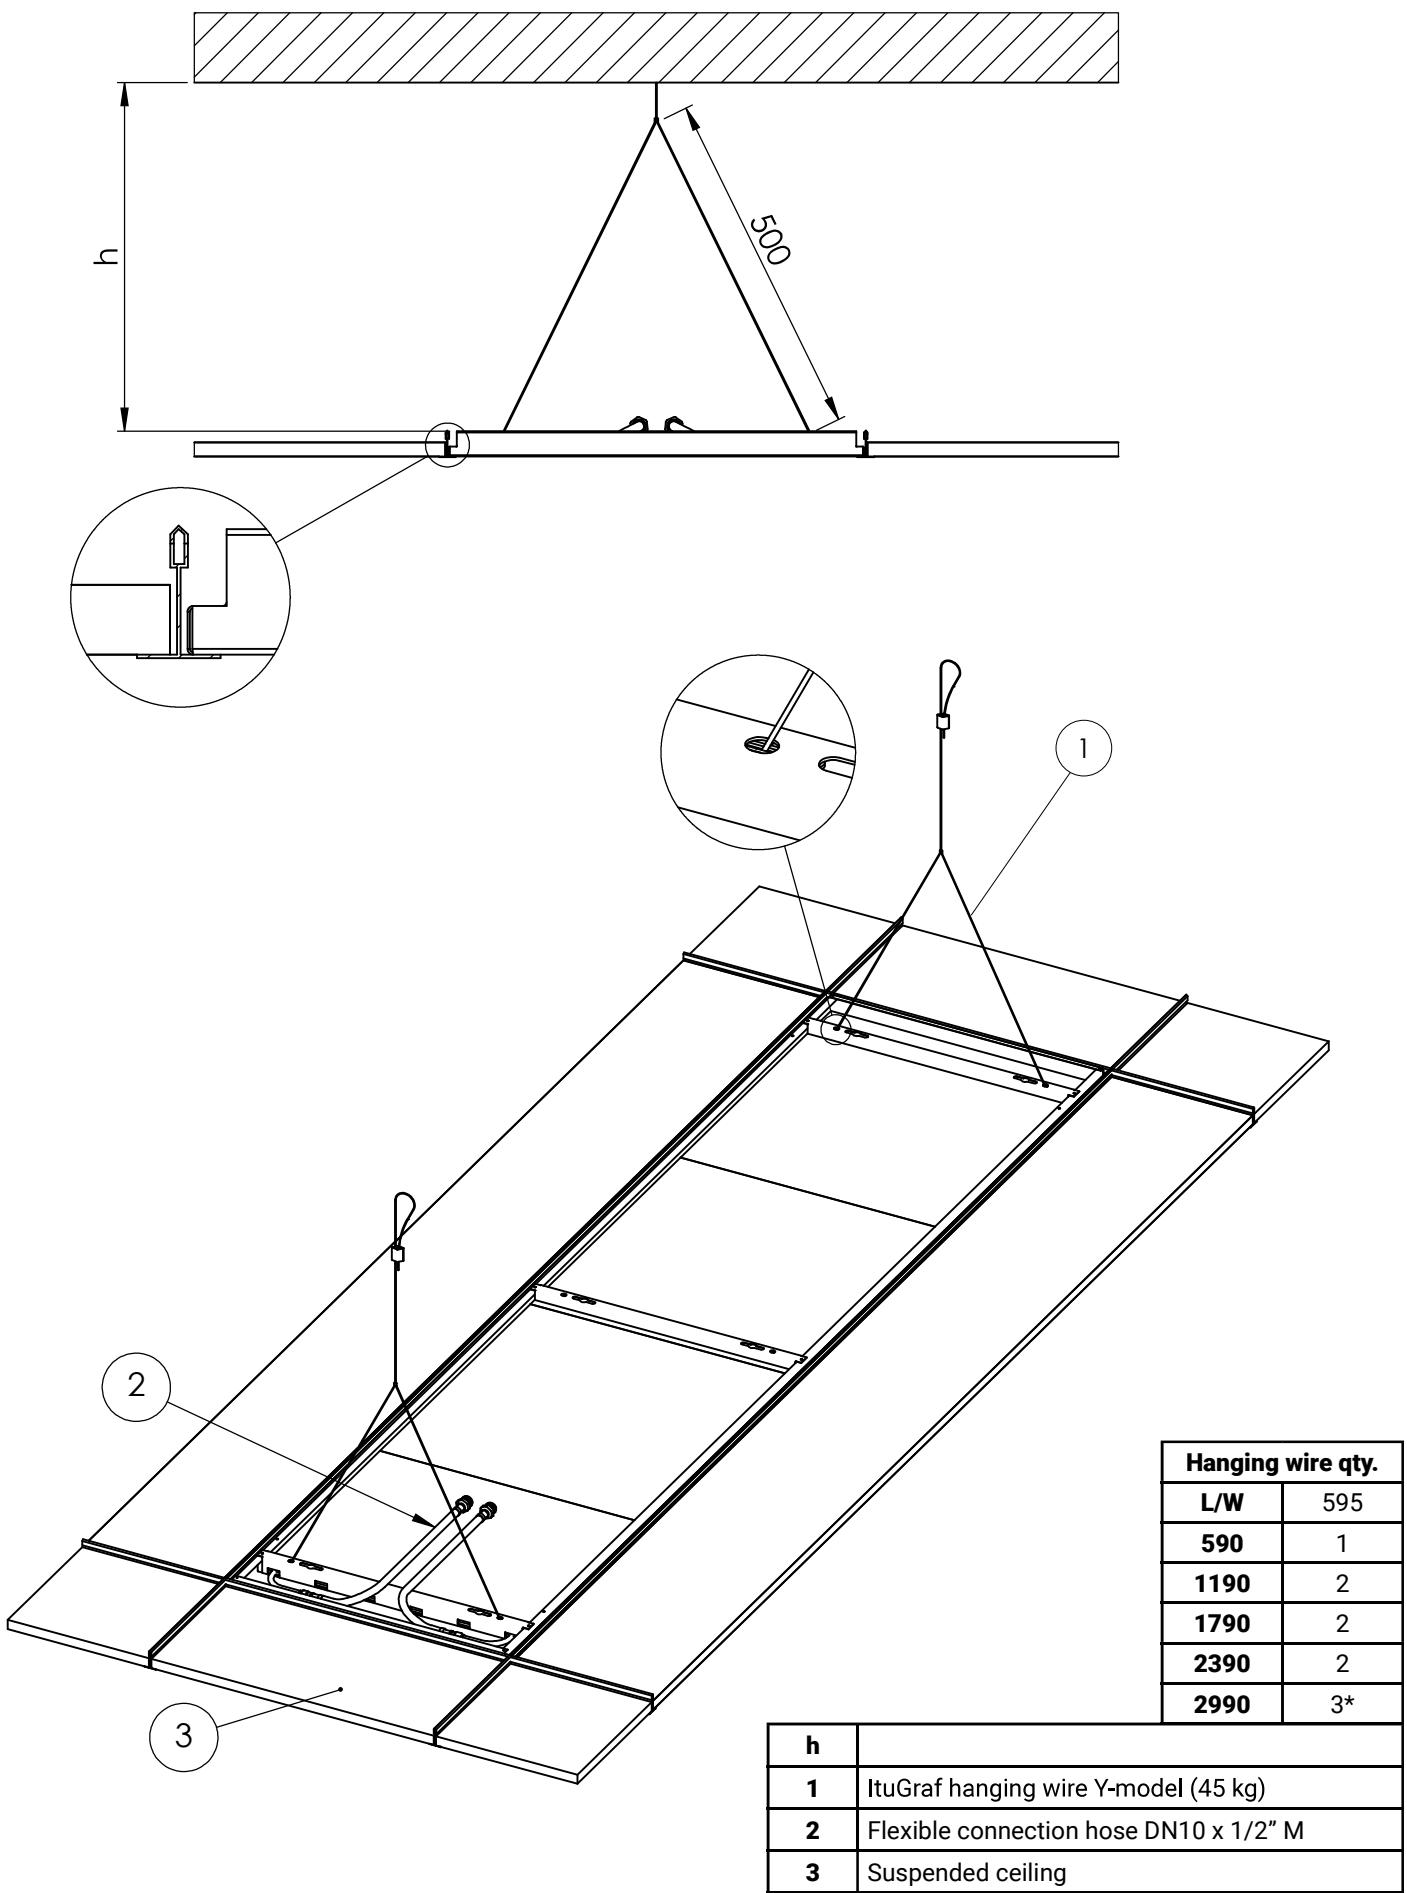

*Quantity of wire depends on the accepted vertical deflection/sagging on site.

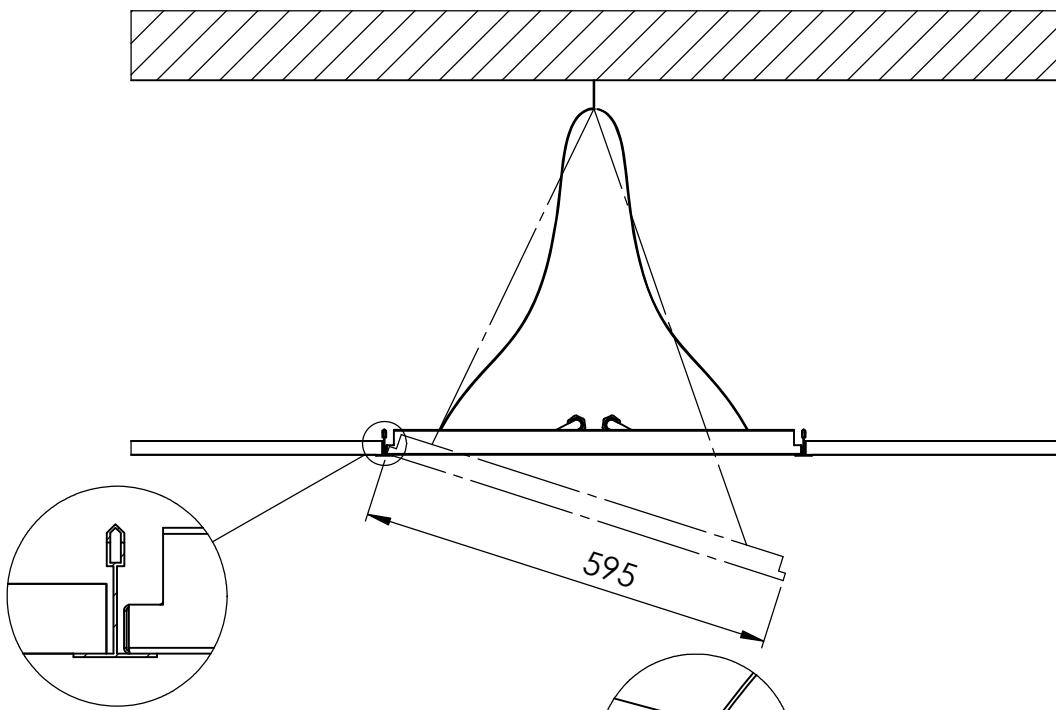

Hanging wire qty.	
L/W	595
590	4
1190	4
1790	4
2390	4
2990	6*

h	
1	ItuGraf hanging wire (15 kg)
2	Flexible connection hose DN10 x 1/2" M
3	Suspended ceiling

*Add 2 hangers on the middle bar when the length is 2990 mm

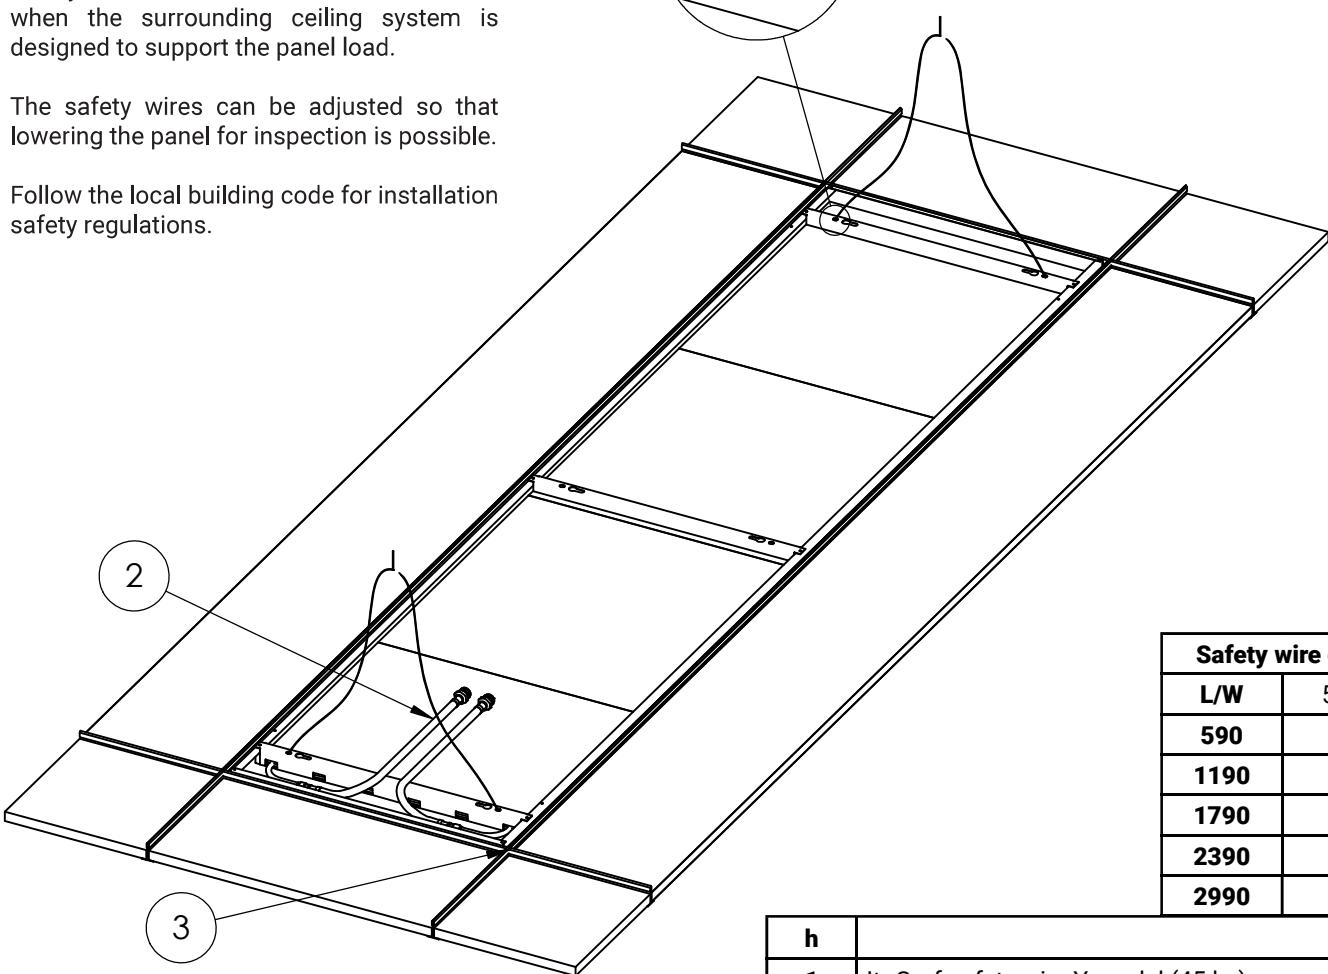

*Add one Y hanger on the middle bar when the length is 2990 mm

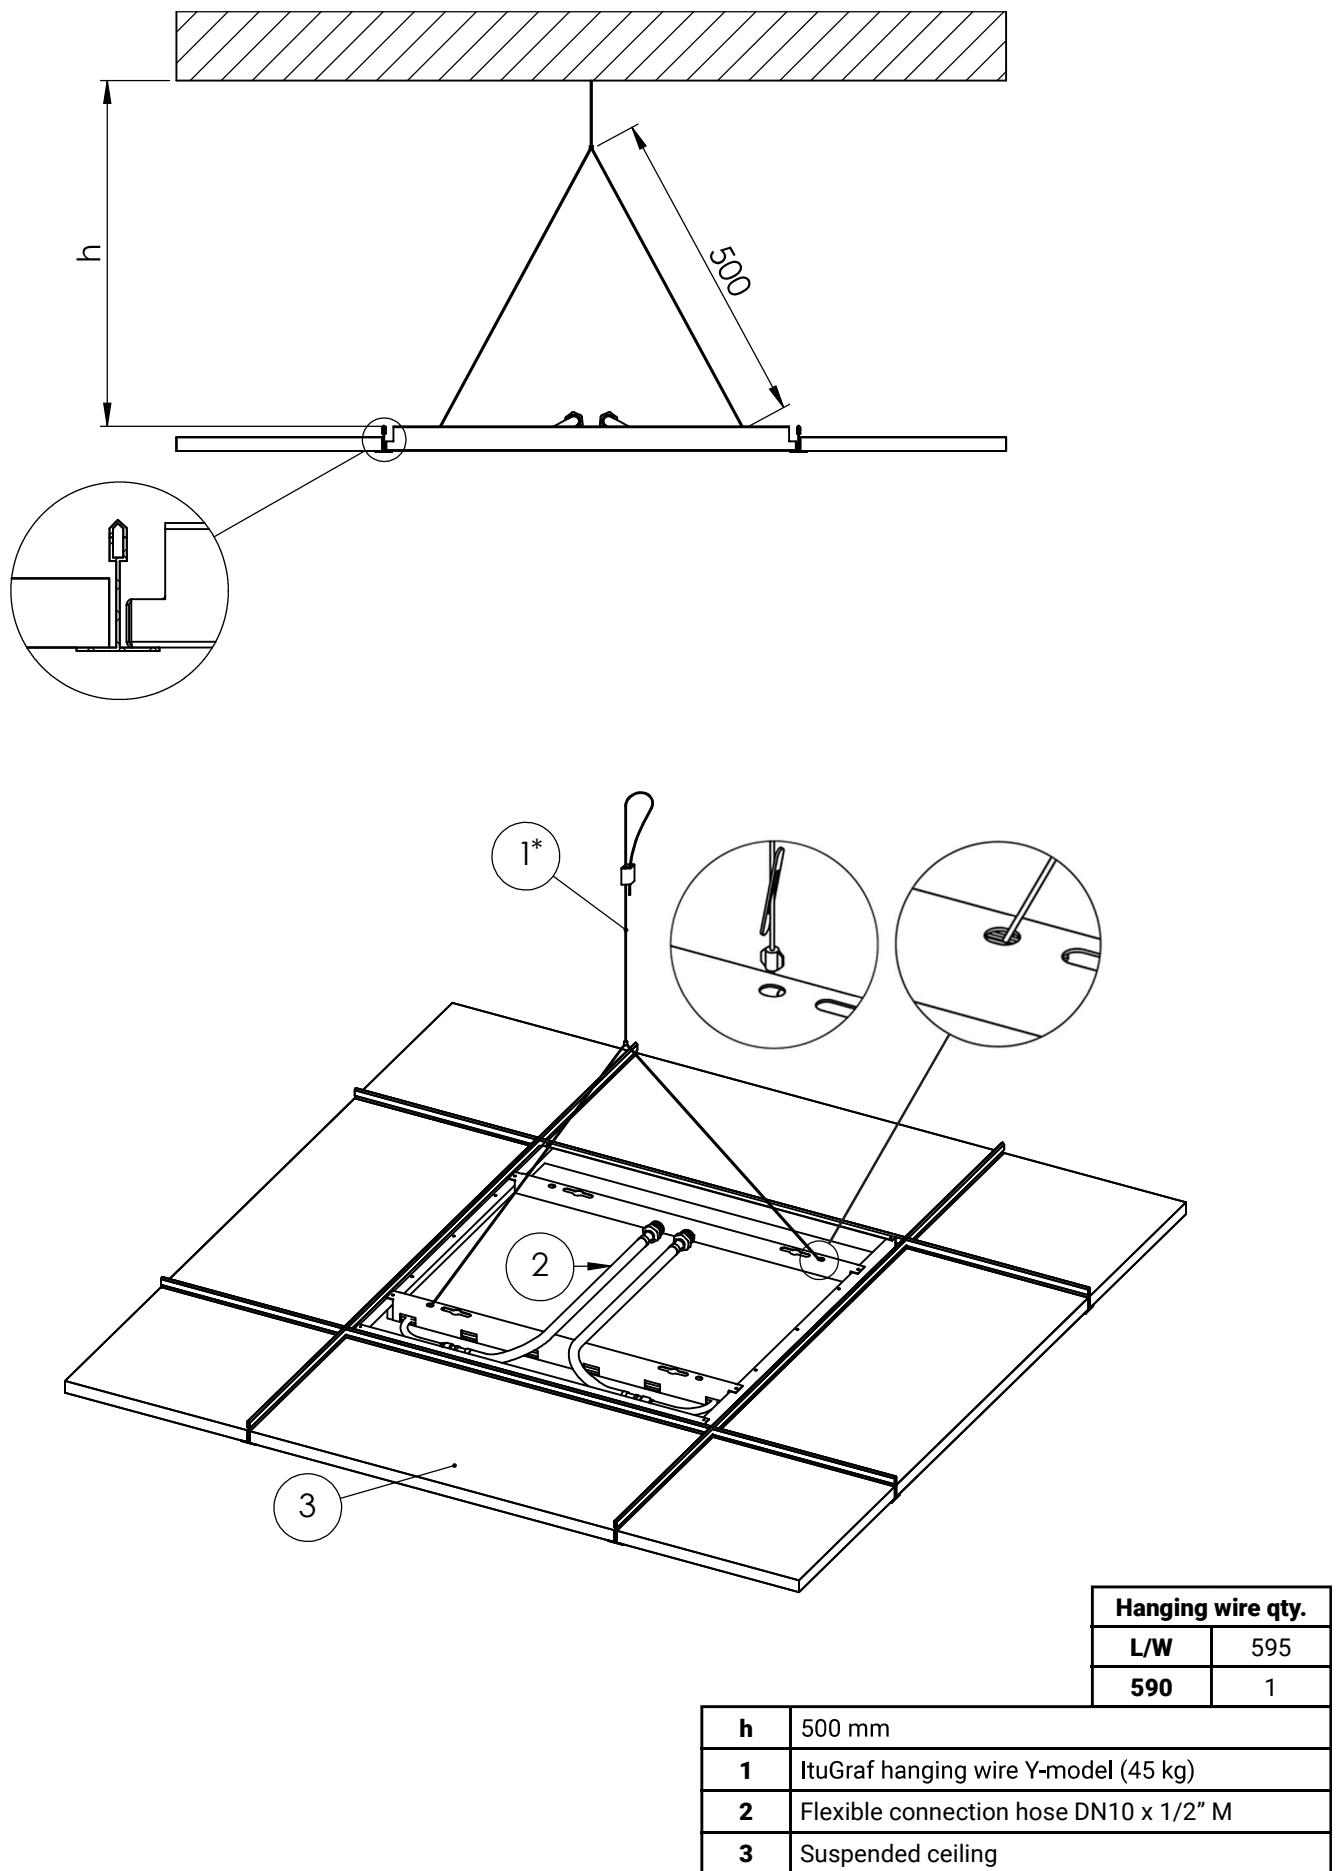

Safety wire installation method can be used when the surrounding ceiling system is designed to support the panel load.

The safety wires can be adjusted so that lowering the panel for inspection is possible.

Follow the local building code for installation safety regulations.

*Add one Y hanger on the middle bar when the length is 2990 mm

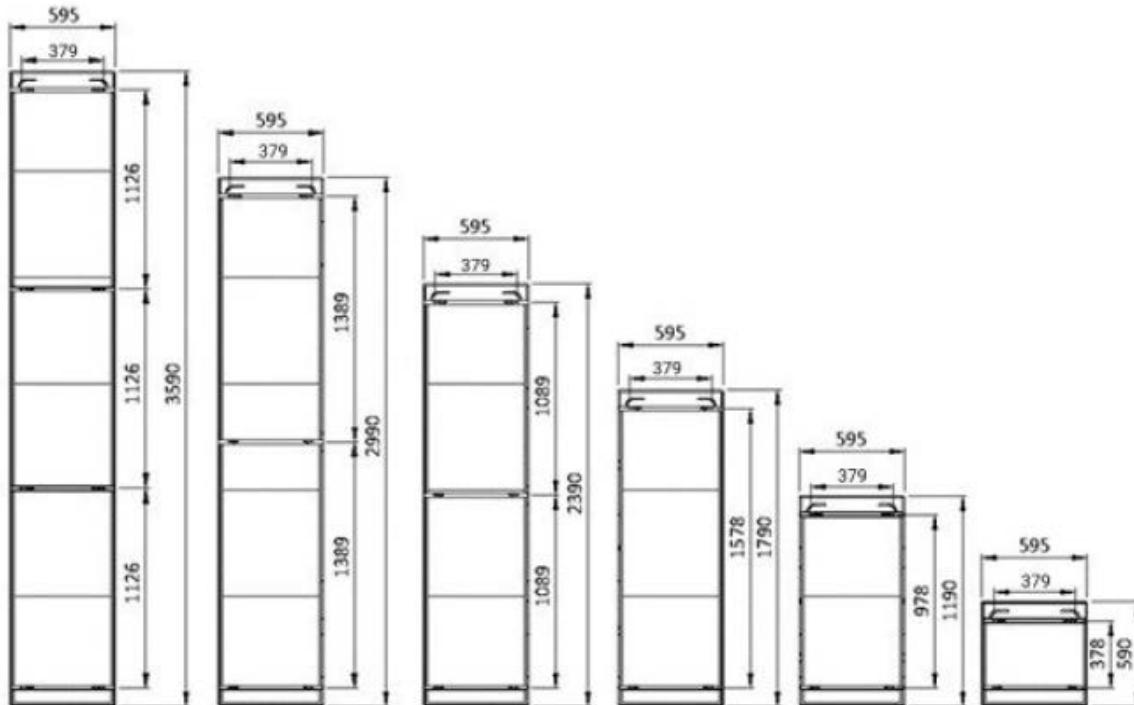

*Only for 600x600 modules.

Fixing Options with Threaded Rods

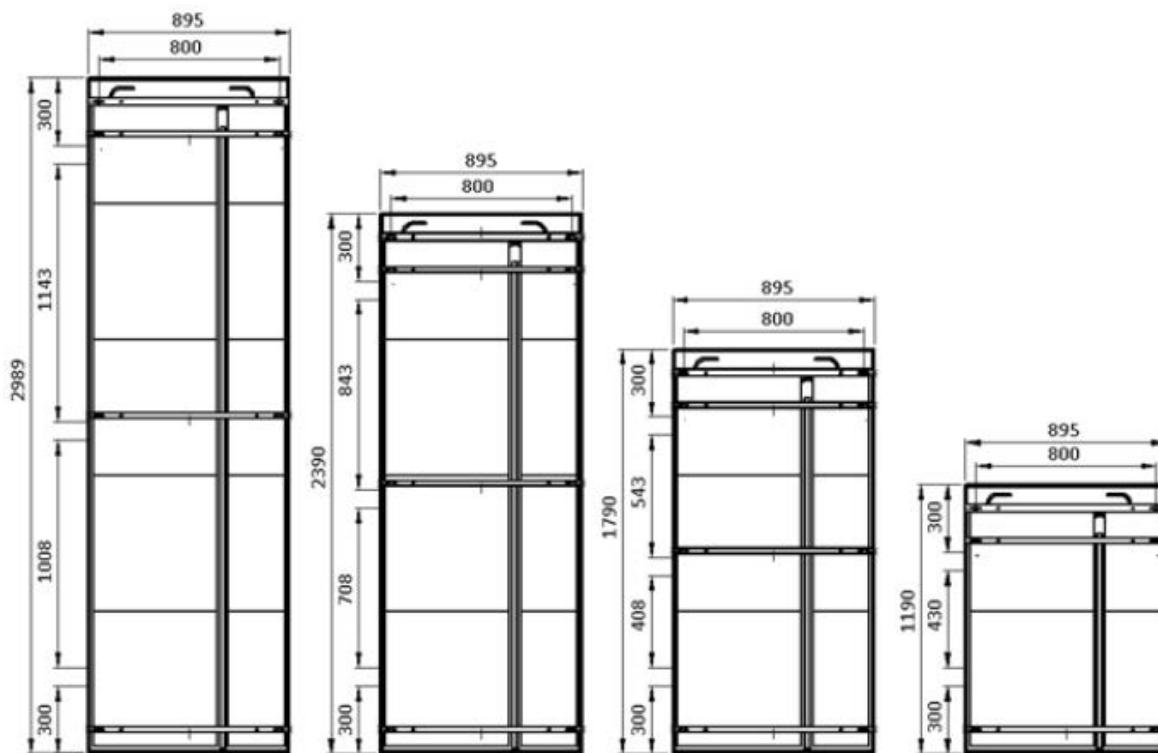

Fixing points of ItuGraf panels

The following figures and tables show the number and positioning of the fixing points for panels with widths of 595 mm, 895 mm and 1190 mm. Threaded rods can be used to fix the panels into the ceiling through holes located in the fixing cross bar.

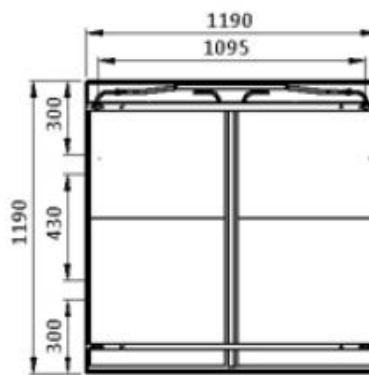

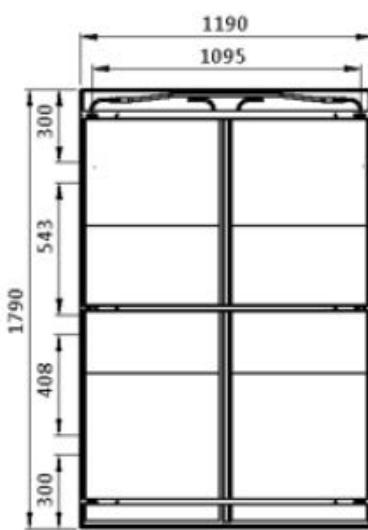

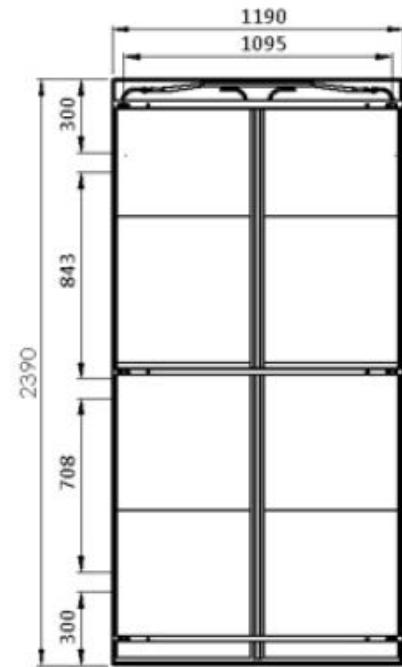

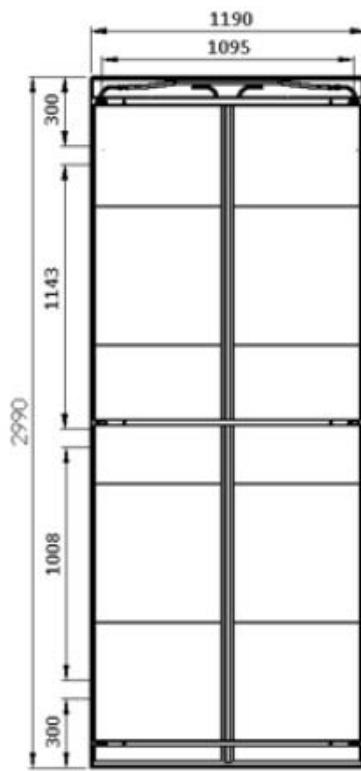

Panel width: 595mm

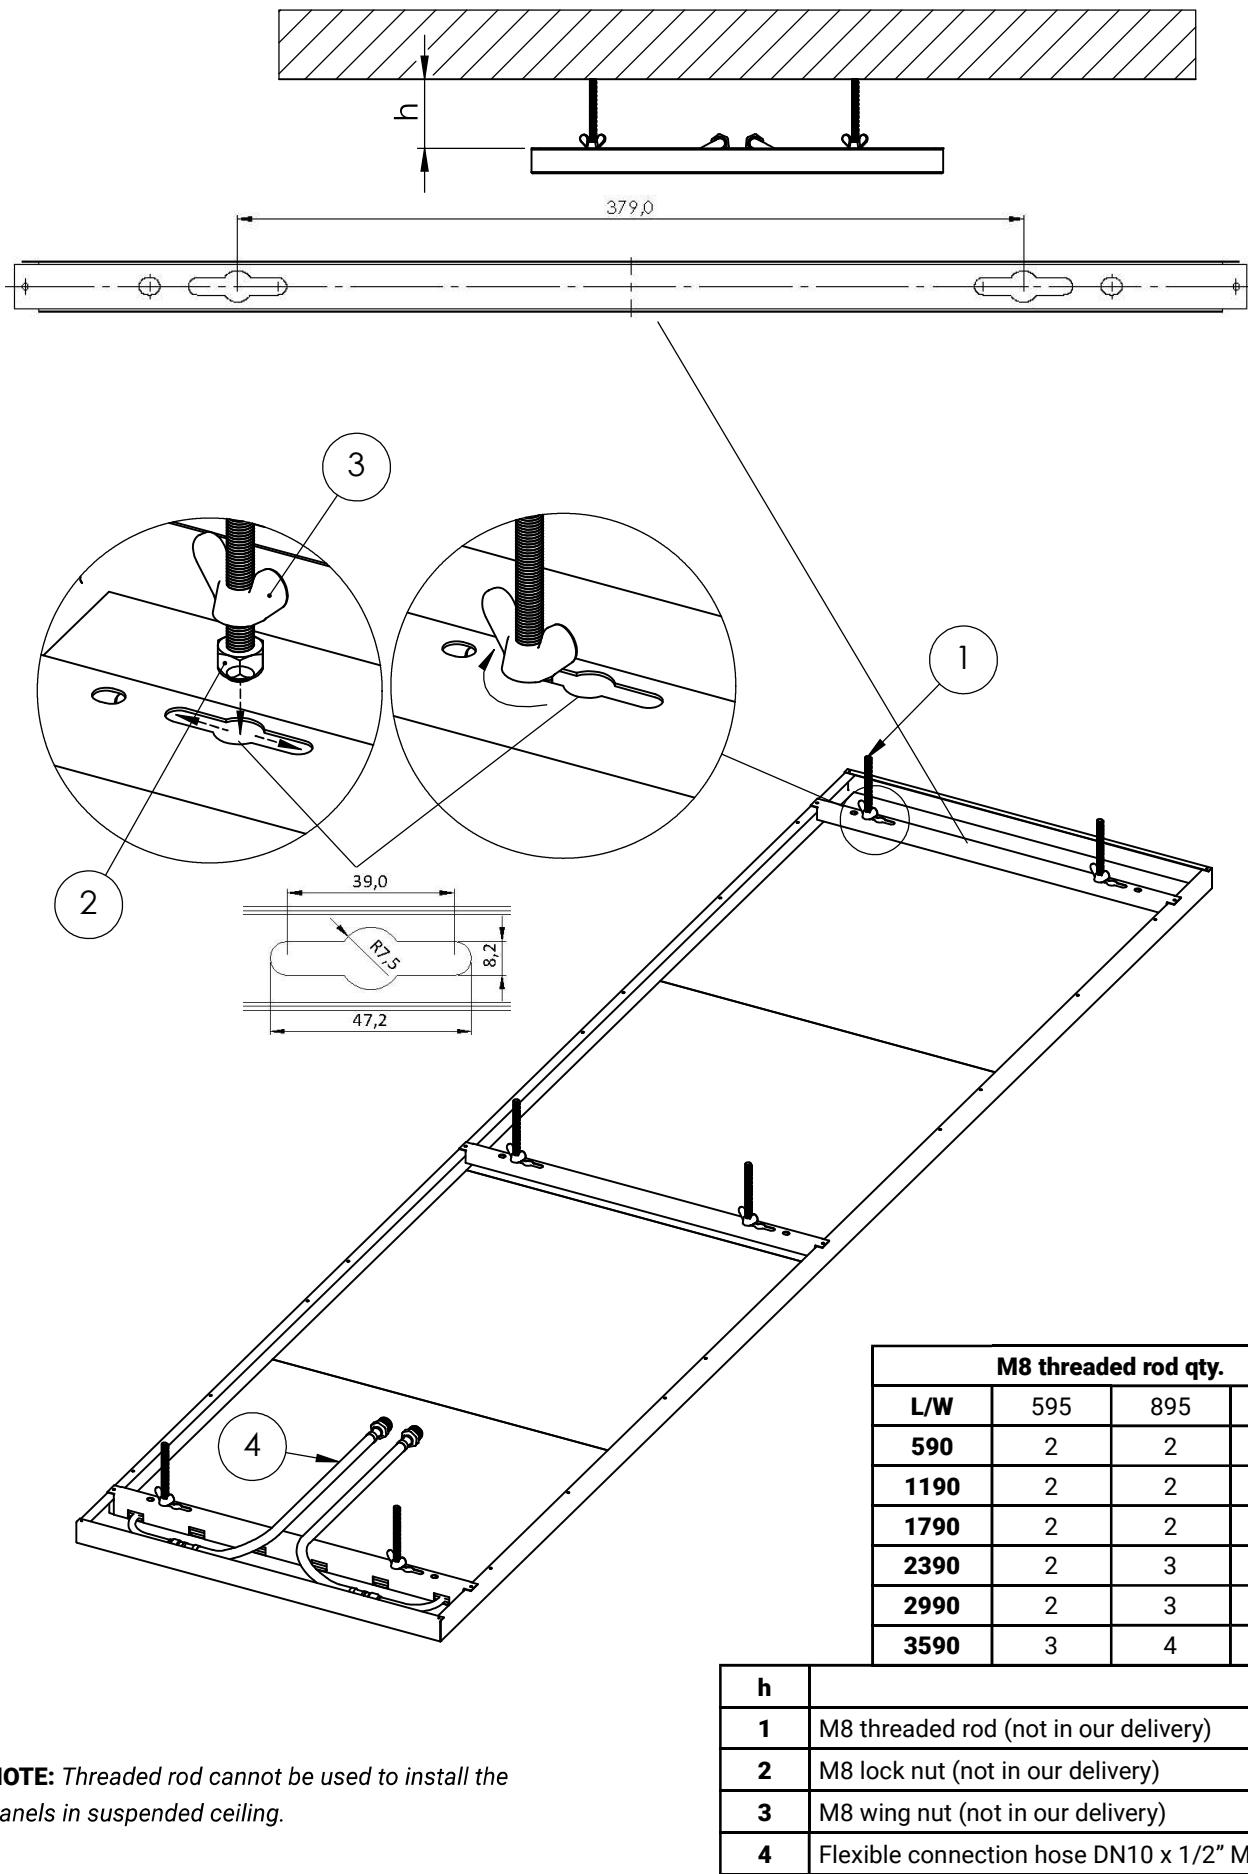

Panel width: 895mm

Panel width: 1190mm

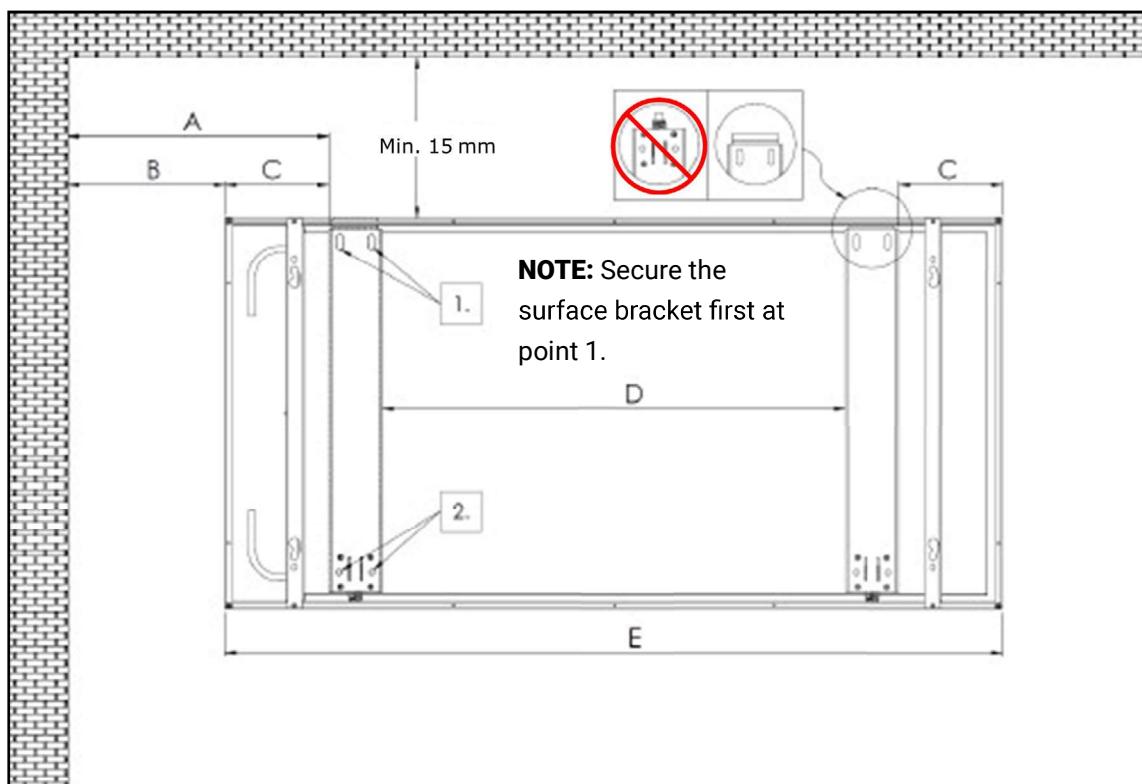

Minimum installation height 100-150 mm (the tightening of wing nuts is still possible).

NOTE: Threaded rod cannot be used to install the panels in suspended ceiling.

NOTE: Number of used fixing points depends on the accepted vertical deflection/sagging on site.

Patented Surface Bracket Hanging Details

Dimensional drawing of ItuGraf surface bracket installation

SYMBOL	MEANING	VALUE (mm)
A	Distance between bracket and wall	B+C
B	Distance between panel end and wall	

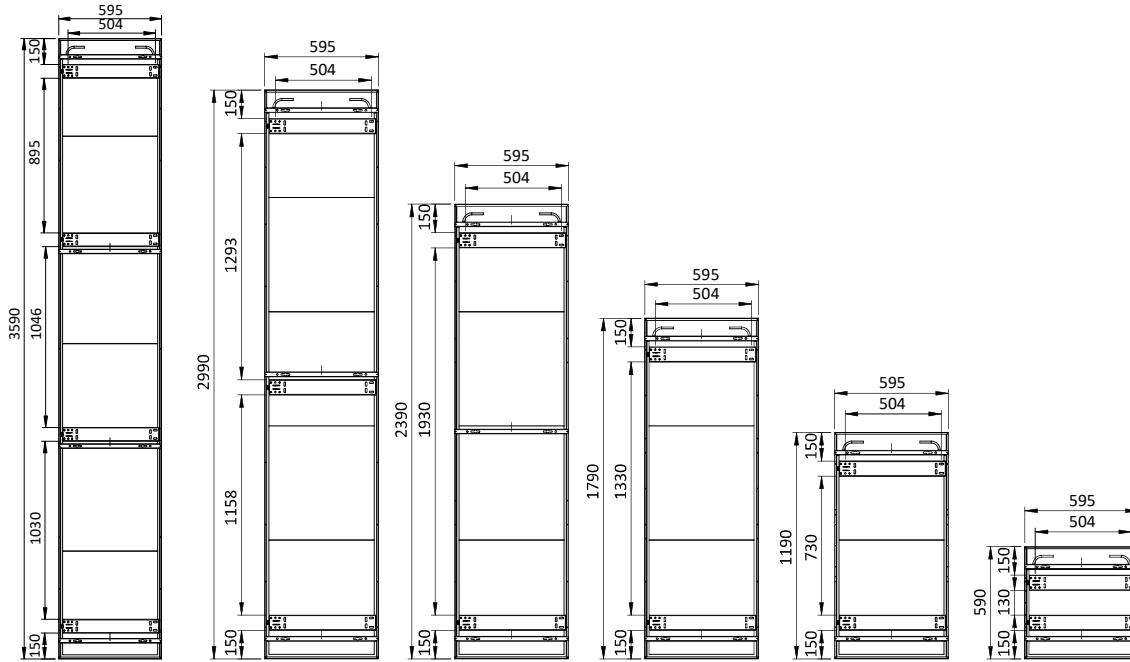

Length (mm)	Number of surface brackets Width 595 mm	Distance from the end of panel (mm) C = width 595mm	Number of surface brackets Width 895 mm	Distance from the end of panel (mm) C = width 895mm	Number of surface brackets Width 1190 mm	Distance from the end of panel (mm) C = width 1190mm

Fixing Options with Patented Surface Bracket

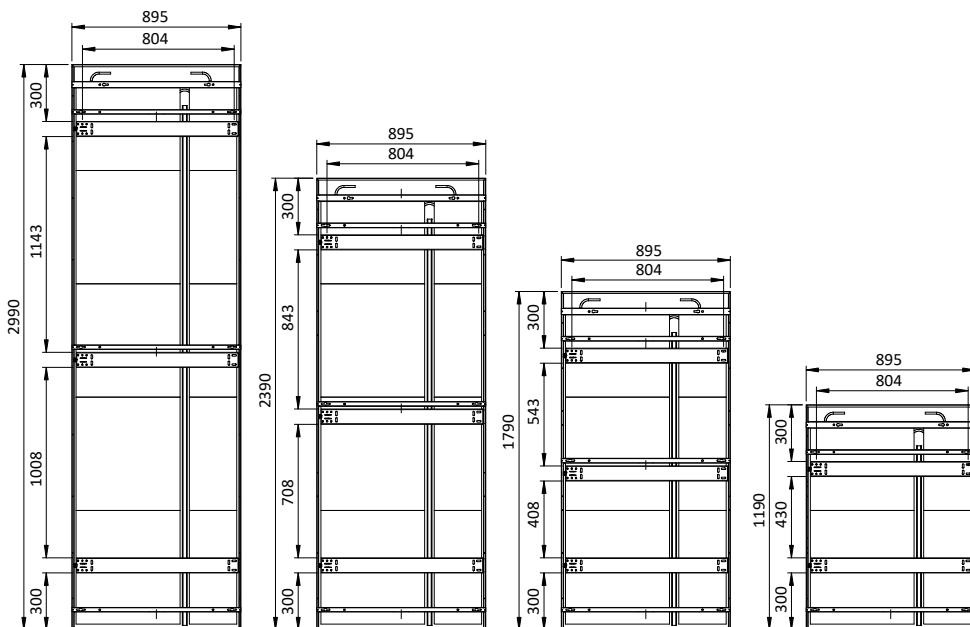

Mounting locations for ItuGraf panels with patented surface brackets

The following figures and tables show the number and mounting locations for panels with widths of 595 mm, 895 mm and 1190 mm.

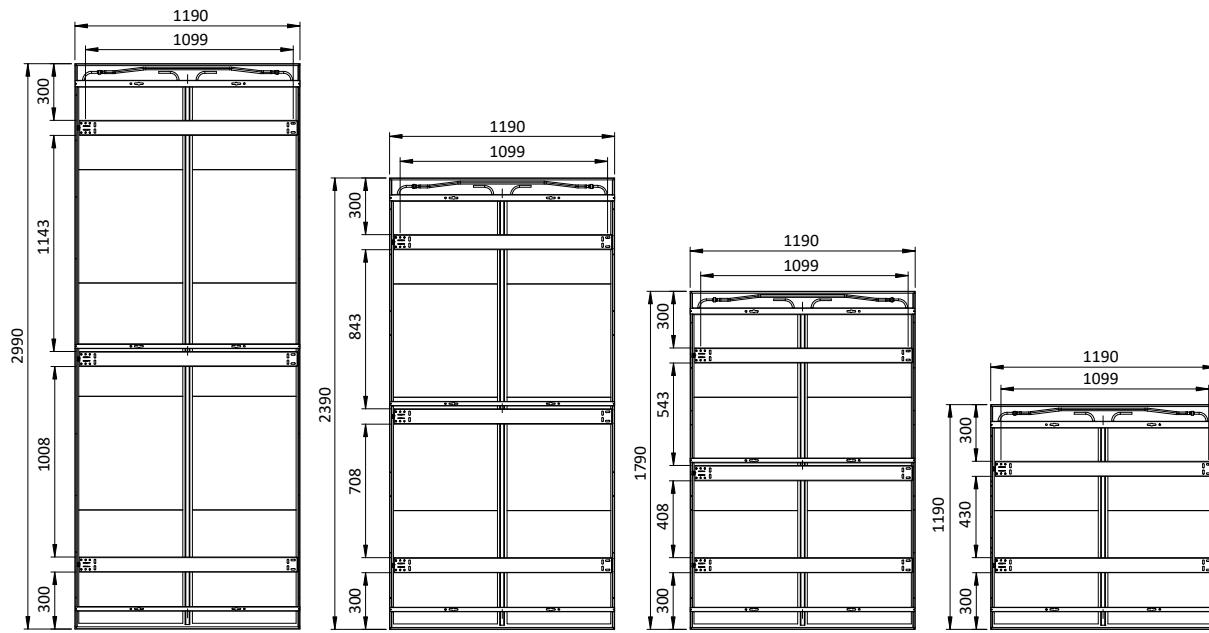

Panel width: 595mm

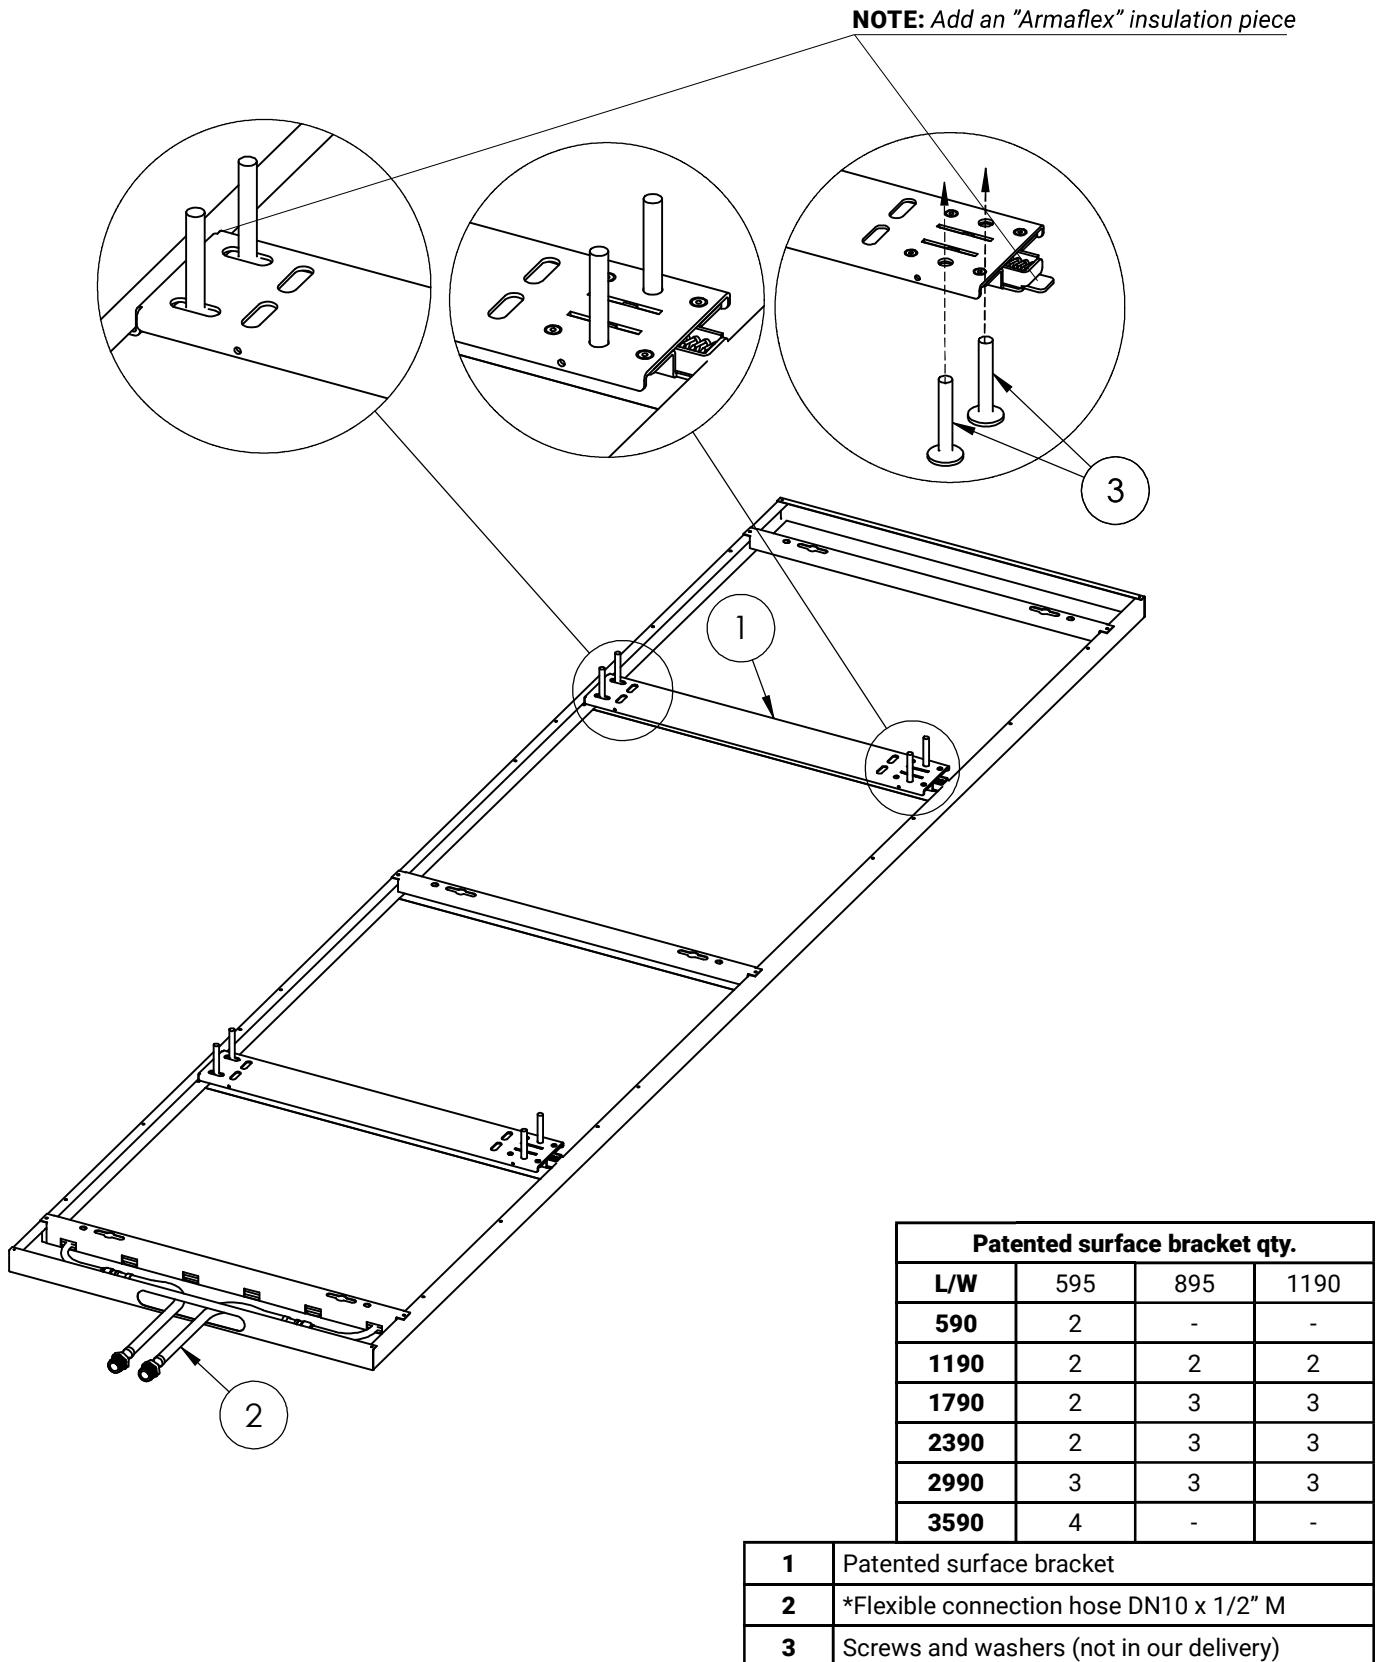

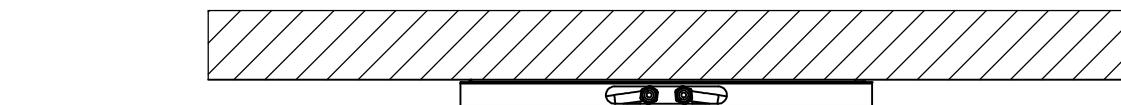

Panel width: 895mm

Panel width: 1190mm

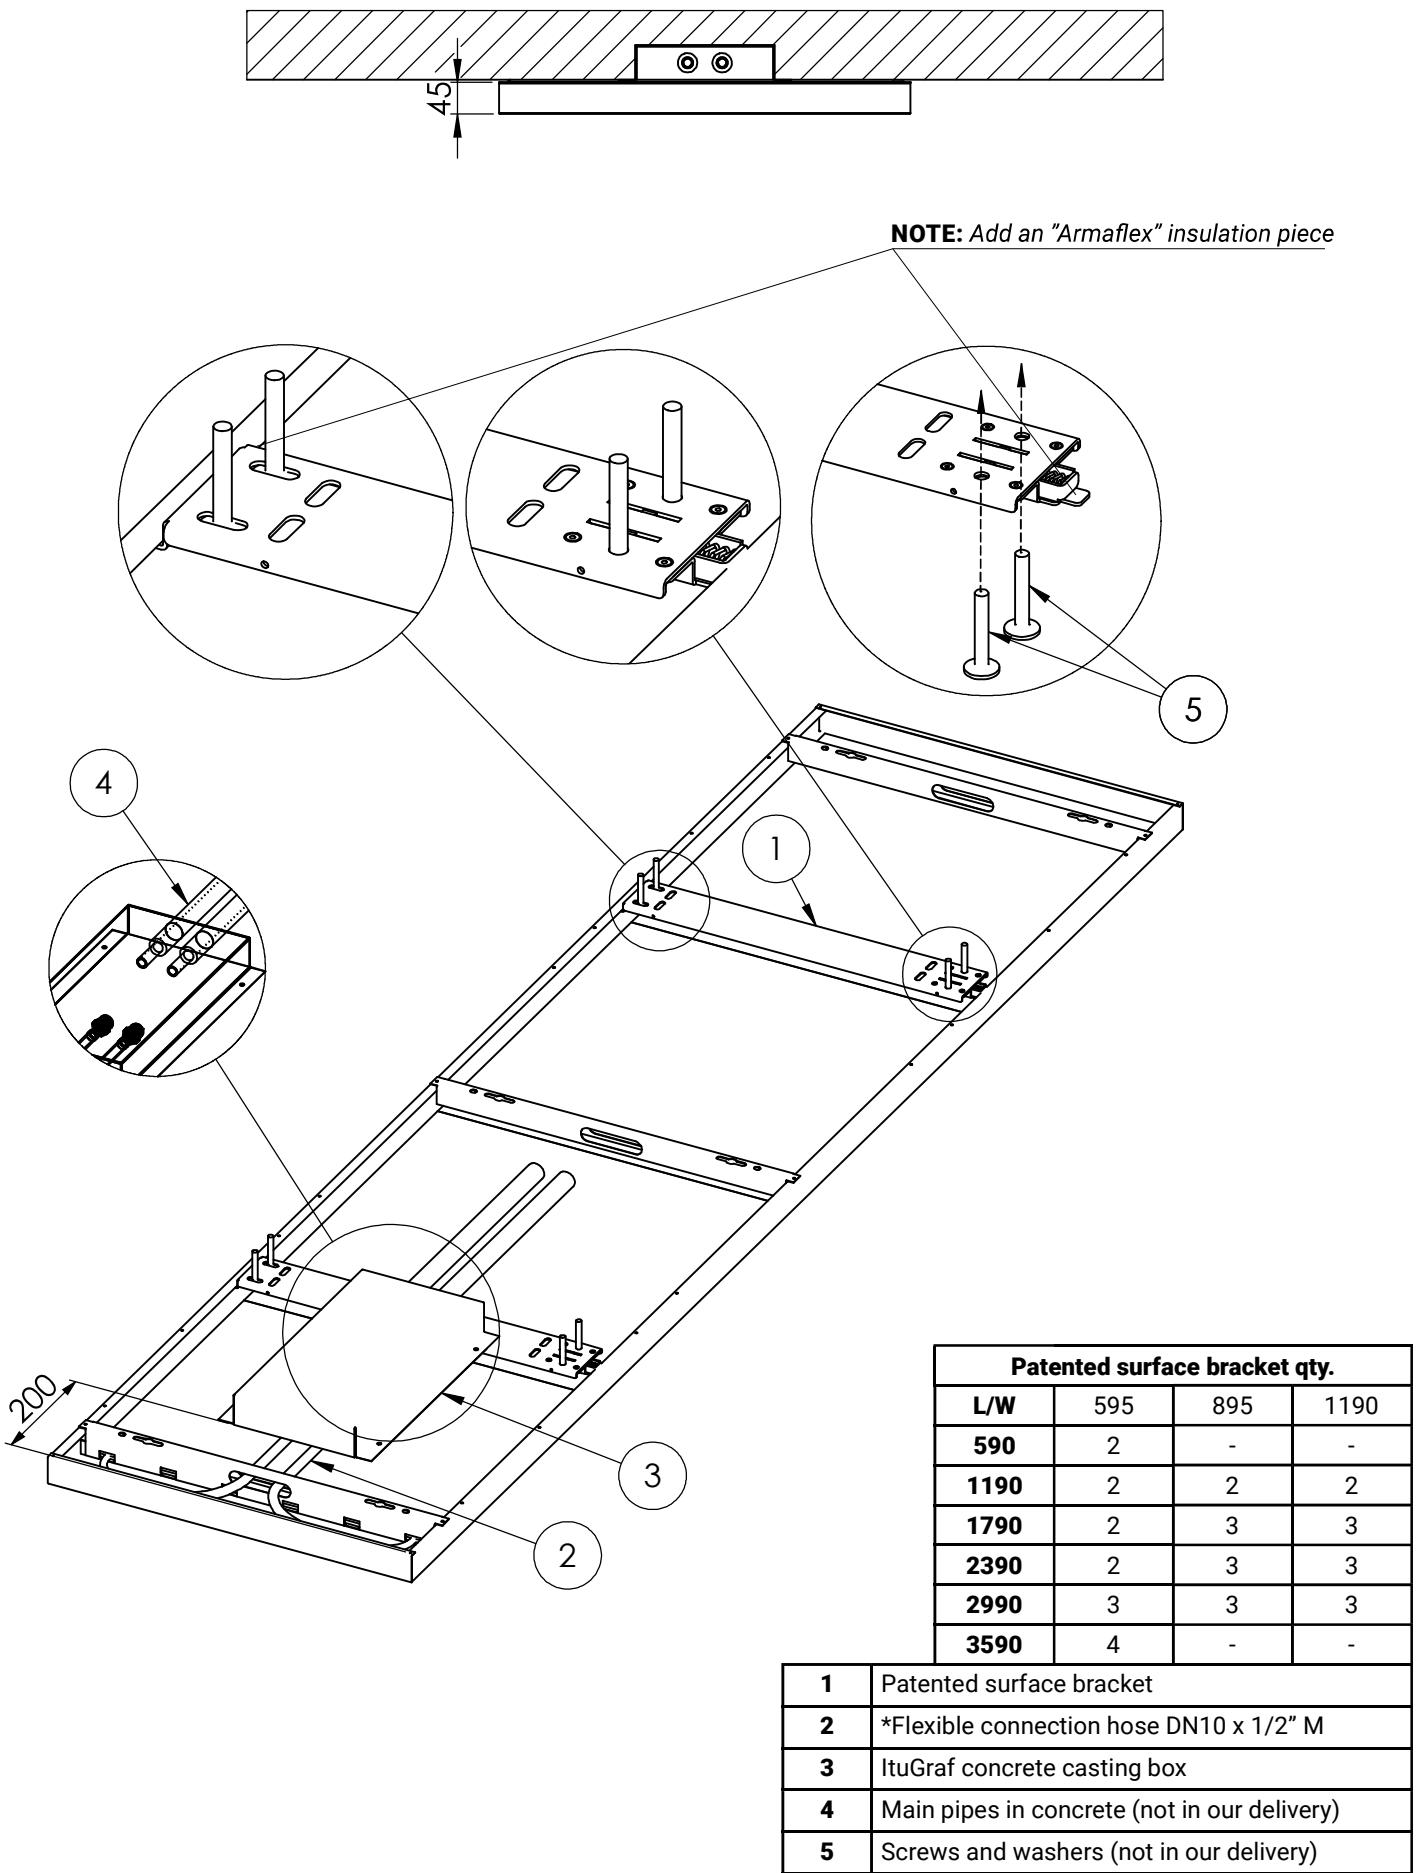

NOTE: 35 mm height panels can be used when flexible hoses are fed through oblong holes in panel ends.

*Flexible hoses need to be insulated to avoid noise due to expansion and/or pressure shocks.

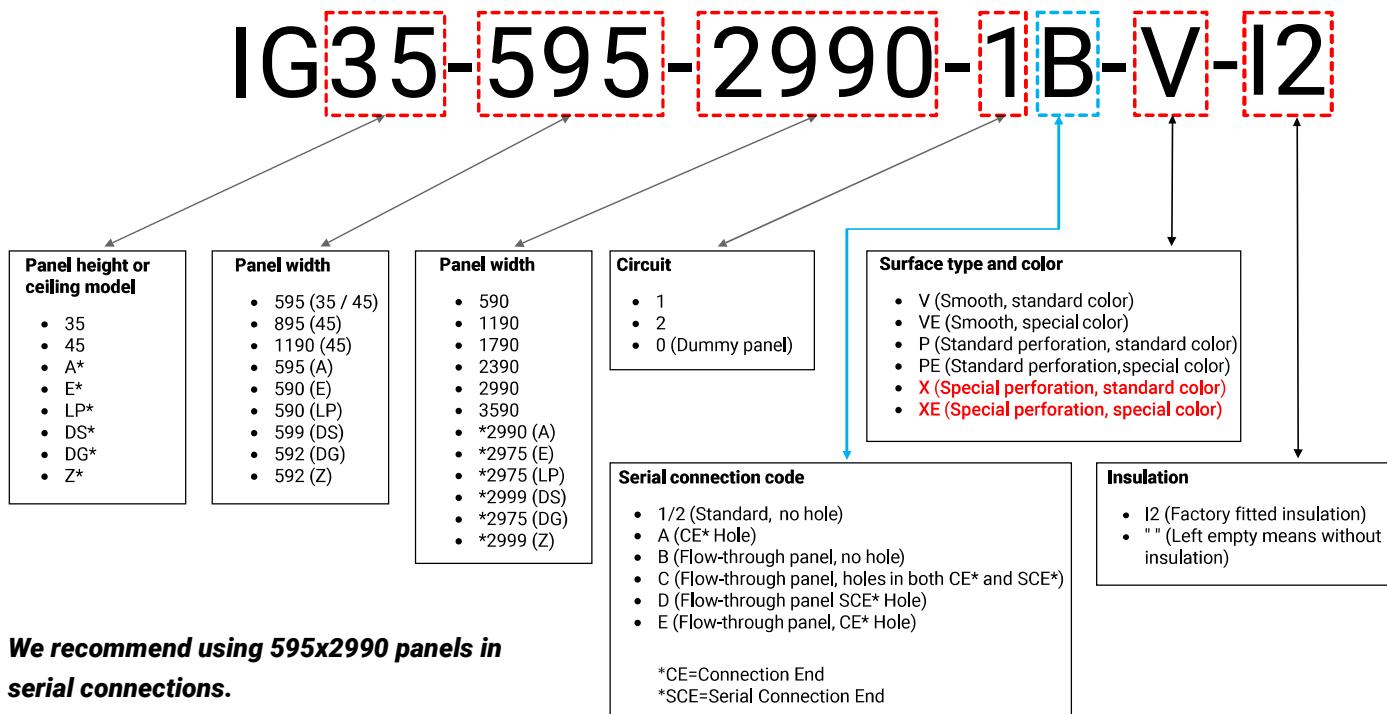

NOTE: Panel height 45 mm must be used.

*Flexible hoses need to be insulated to avoid noise due to expansion and/or pressure shocks.

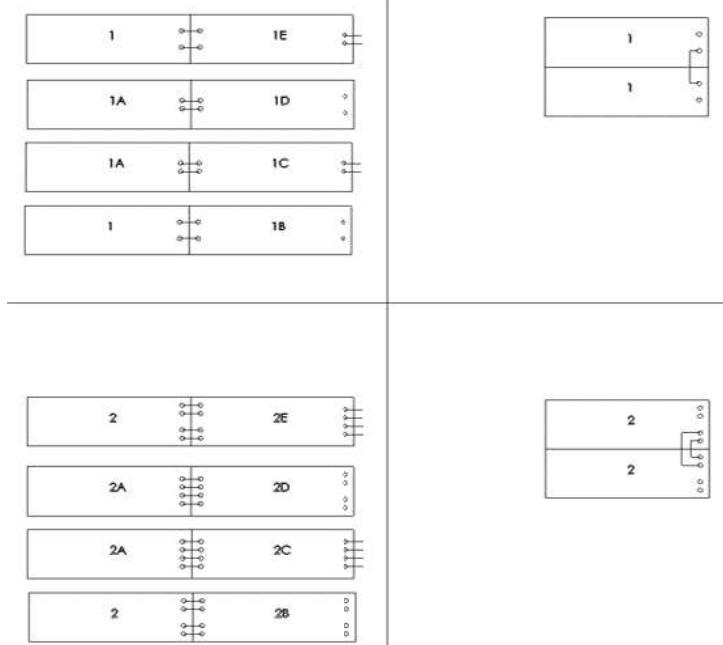

Legend for the Panel Product Codes

ItuGraf product codes are formed as shown below.

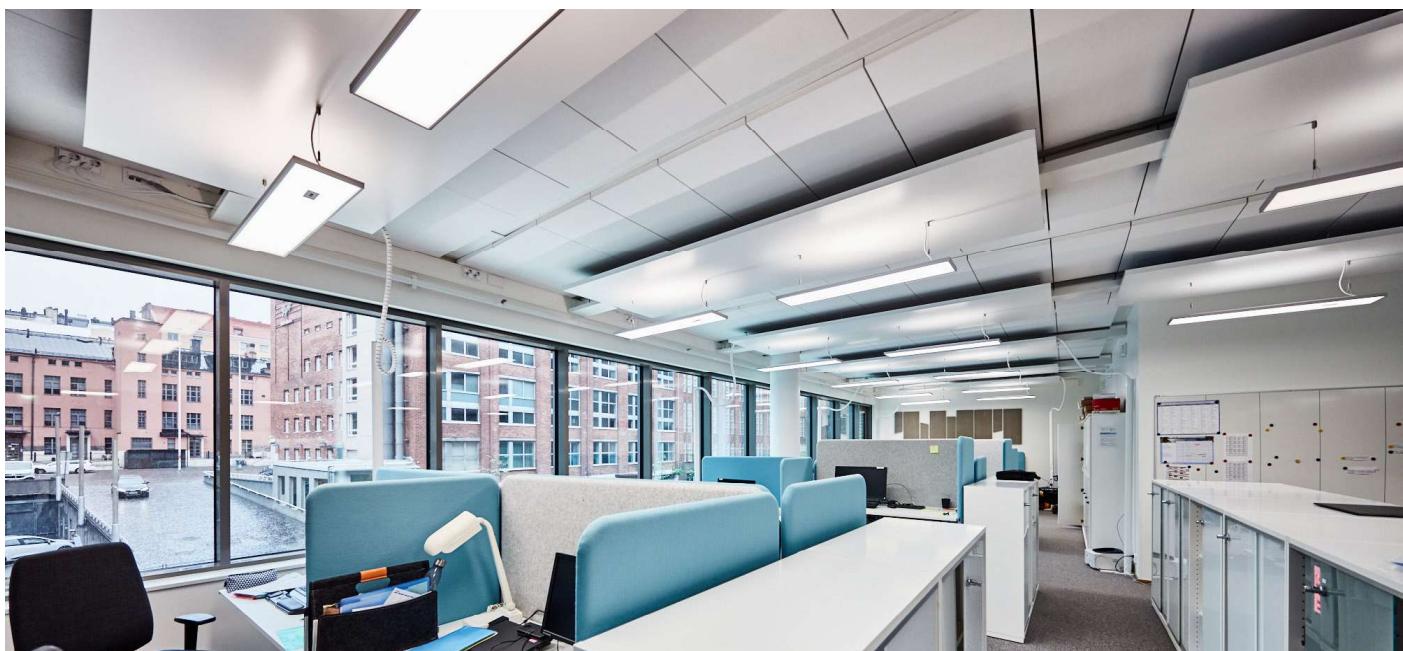

We recommend using 595x2990 panels in serial connections.

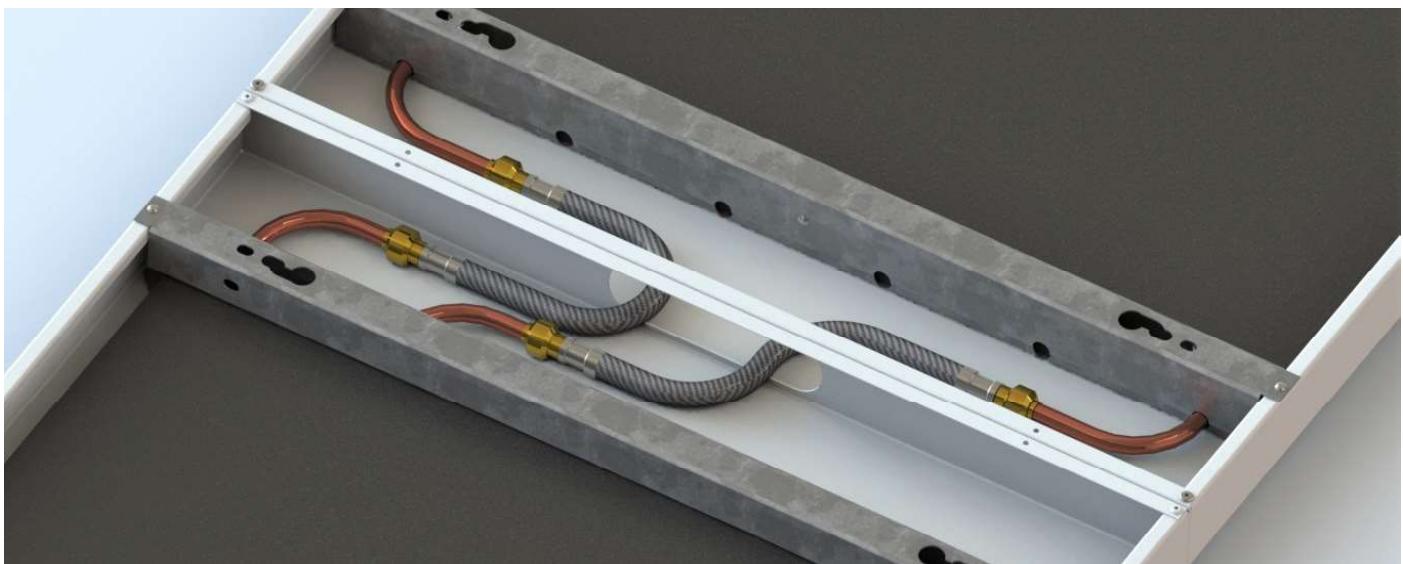

Serial Connection Code	Description: CE=Connection End SCE=Serial Connection End
1	1-Circuit, Standard No Hole
1A	1-Circuit CE Hole
1B	1-Circuit, Flow-through technology No Hole
1C	1-Circuit, Flow-through technology Holes in both CE and SCE
1D	1-Circuit, Flow-through technology SCE Hole
1E	1-Circuit, Flow-through technology CE Hole
2	2-Circuit, Standard No Hole
2A	2-Circuit CE Hole
2B	2-Circuit, Flow-through technology No Hole
2C	2-Circuit, Flow-through technology Holes in both CE and SCE
2D	2-Circuit, Flow-through technology SCE Hole
2E	2-Circuit, Flow-through technology CE Hole

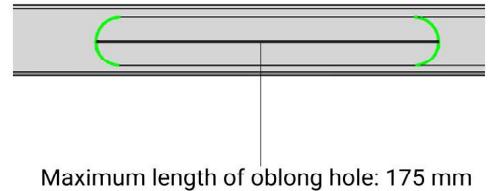

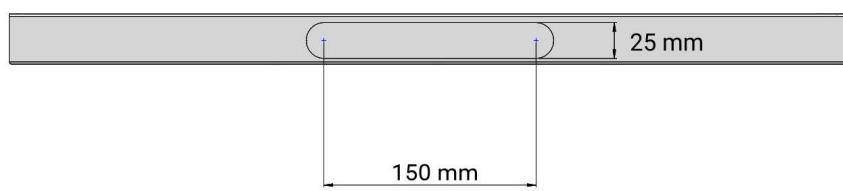

Serial & Parallel Panel Connections

ItuGraf panels can be connected in serie in according to room specifics. The used product type is influenced by the selected installation method. The standard panels can be used when they are hung with cable wires. When the patented surface bracket installation is used the panels should have holes in the ends for water connections. If the water supply is brought to the panel through the ceiling the panel height of 45 mm should be used so that the hoses fit through the crossbars see [page 43](#).

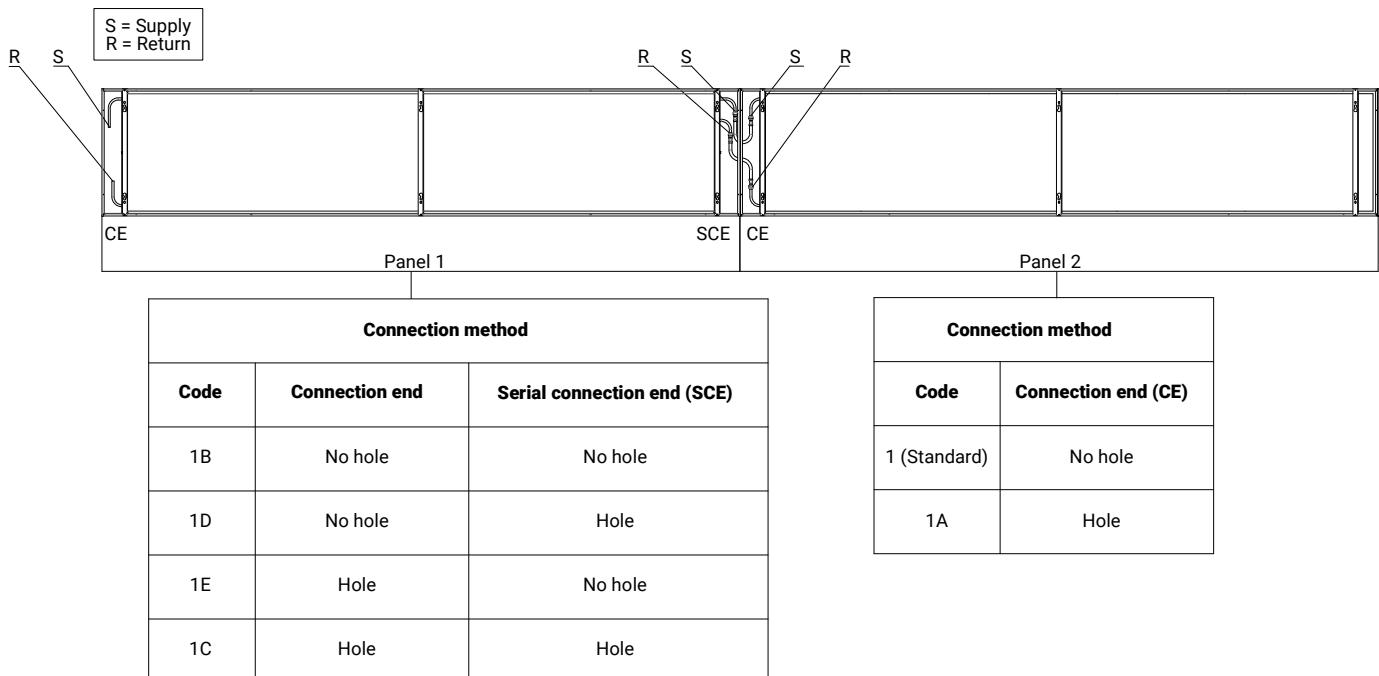

Section view of the connection end hole is seen below. The flexible hoses are installed through the holes connecting the panel pipes together.

Examples of ItuGraf Serial Panel Connections

1-Circuit - serial connection with two panels in line

When the flexible connection hoses can be drawn over the panel edge

Connect the panel 1B or 1E (SCE no hole) to the panel 1 (Standard / no hole).

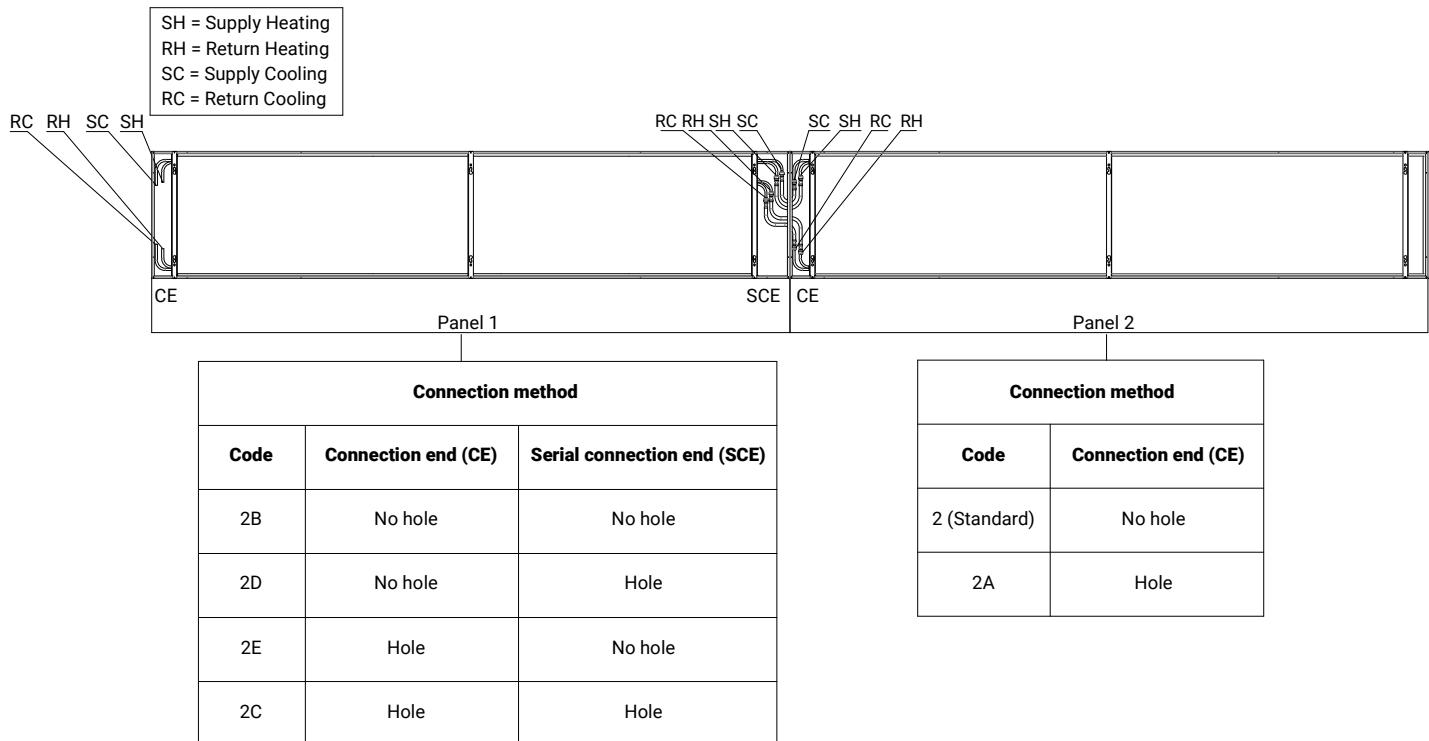

For example PANEL 1: IG35-595-2990-1B-V connected to the PANEL 2: IG35-595-2990-1-V

When the flexible connection hoses need to be drawn through the panel

Connect the panel 1D or 1C (SCE hole) to the panel 1A (CE hole).

For example PANEL 1: IG35-595-2990-1C-V connected to the PANEL 2: IG35-595-2990-1A-V

2 Circuits - serial connection with two panels in line

When the flexible connection hoses can be drawn over the panel edge

Connect the panel 2B or 2E (SCE no hole) to the panel 2 (Standard / no hole).

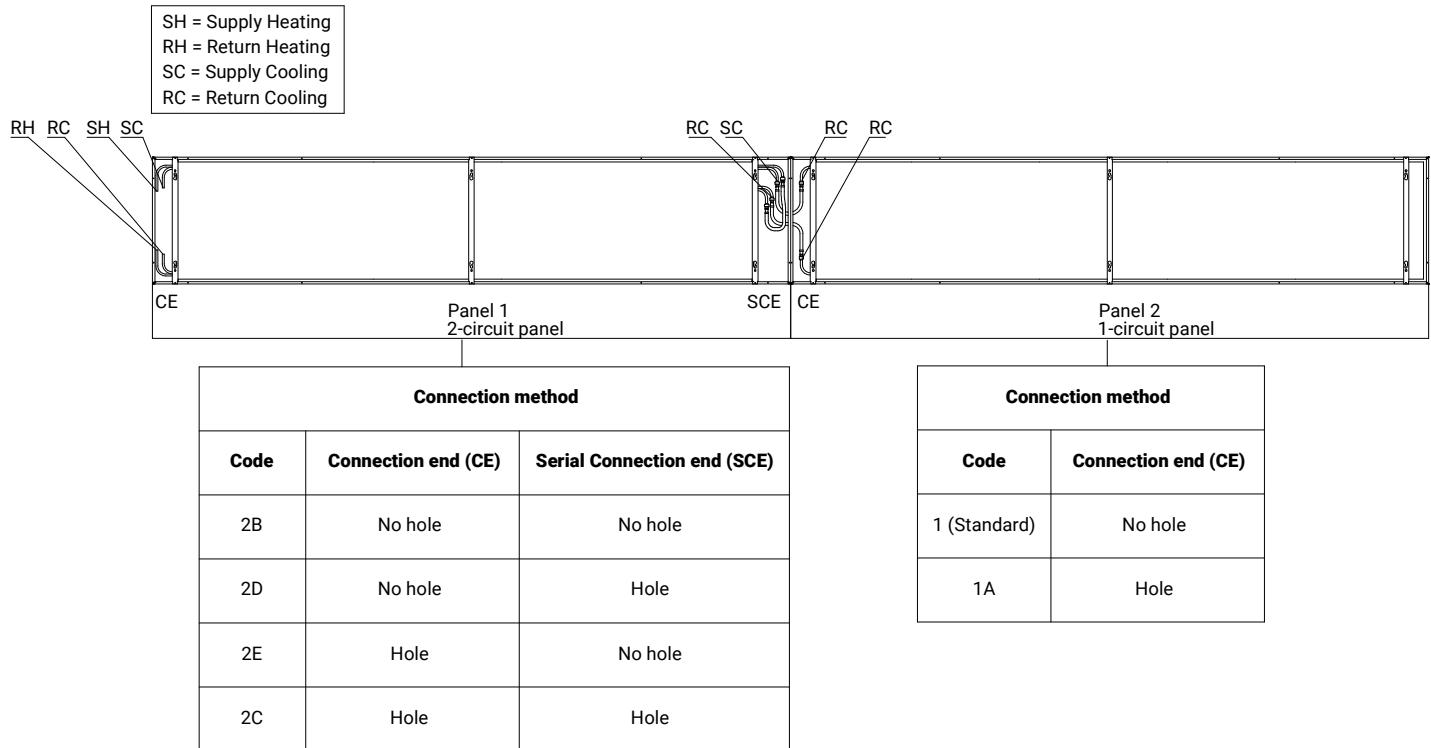

For example PANEL 1: IG35-595-2990-2B-V connected to the PANEL 2: IG35-595-2990-2-V

When the flexible connection hoses need to be drawn through the panel

Connect the panel 2D or 2C (SCE hole) to the panel 2A (CE hole).

For example PANEL1: IG35-595-2990-2C-V connected to the PANEL 2: IG35-595-2990-2A-V

1 & 2 Circuits combined - serial connection with two panels in line

First panel (on the left) with flow through technology for heating and for cooling with two meander pipes. Second panel (on the right) for extended cooling capacity with single meander pipe. First panel heating circuit will be short-cut closed at SCE (Serial Connection End) with a flexible hose.

When the flexible connection hoses can be drawn over the panel edge

Connect the panel 2B or 2E (SCE no hole) to the panel 1 (Standard / no hole).

For example PANEL 1: IG35-595-2990-2B-V connected to the PANEL 2: IG35-595-2990-1-V

When the flexible connection hoses need to be drawn through the panel

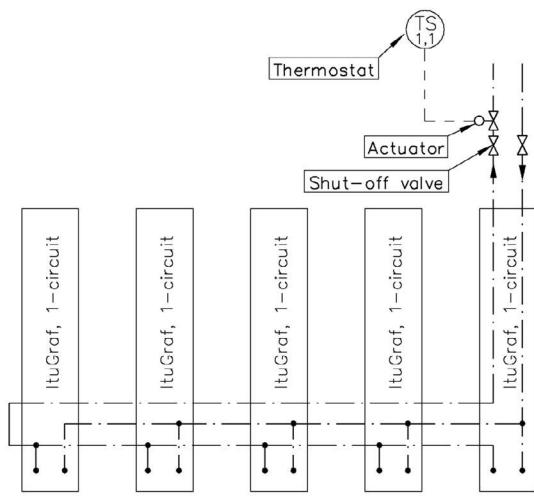

Connect the panel 2D or 2C (SCE hole) to the panel 1A (CE hole).

For example PANEL 1: IG35-595-2990-2C-V connected to the PANEL 2: IG35-595-2990-1A-V

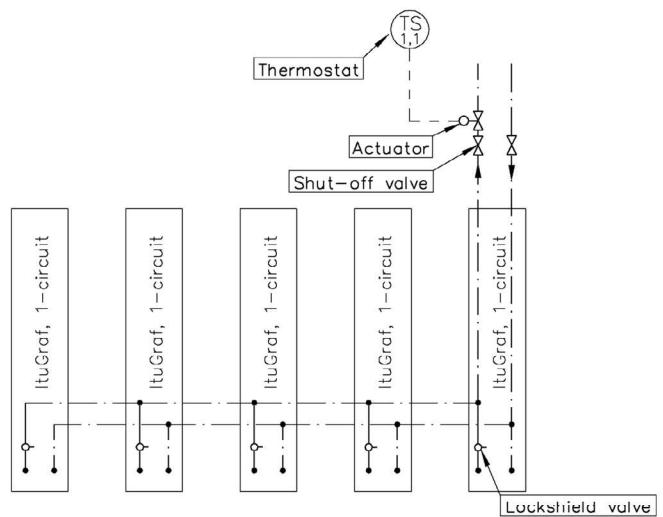

Examples of Controls for Various Panel Connections

Below are presented the most typical connections for ItuGraf panels.

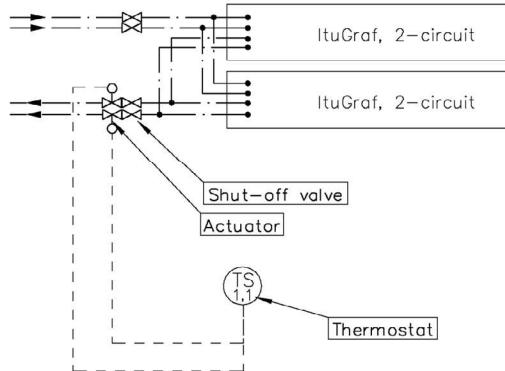

1-circuit panels
Parallel connection with reverse return
(Every panel are in balance)

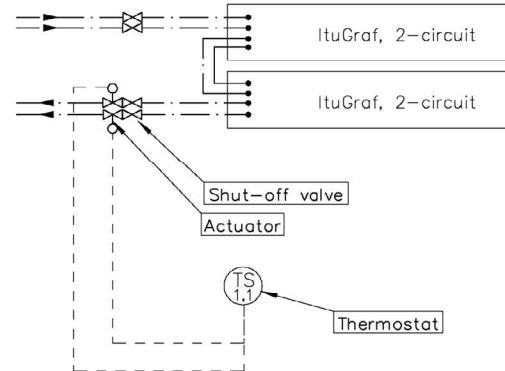

1-circuit panels
Parallel connection without reverse return
(Lockshield valves for balancing)

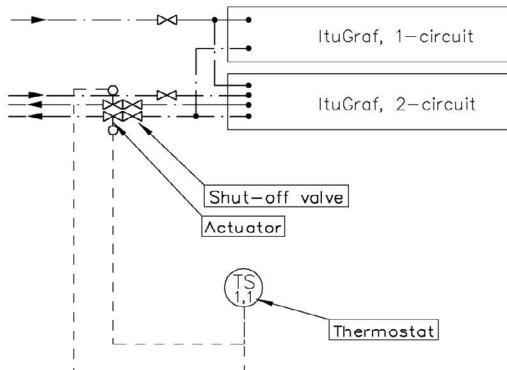

2-circuit panels
Parallel connection

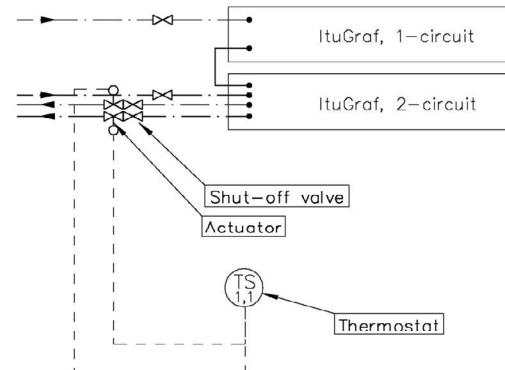

2-circuit panels
Serial connection

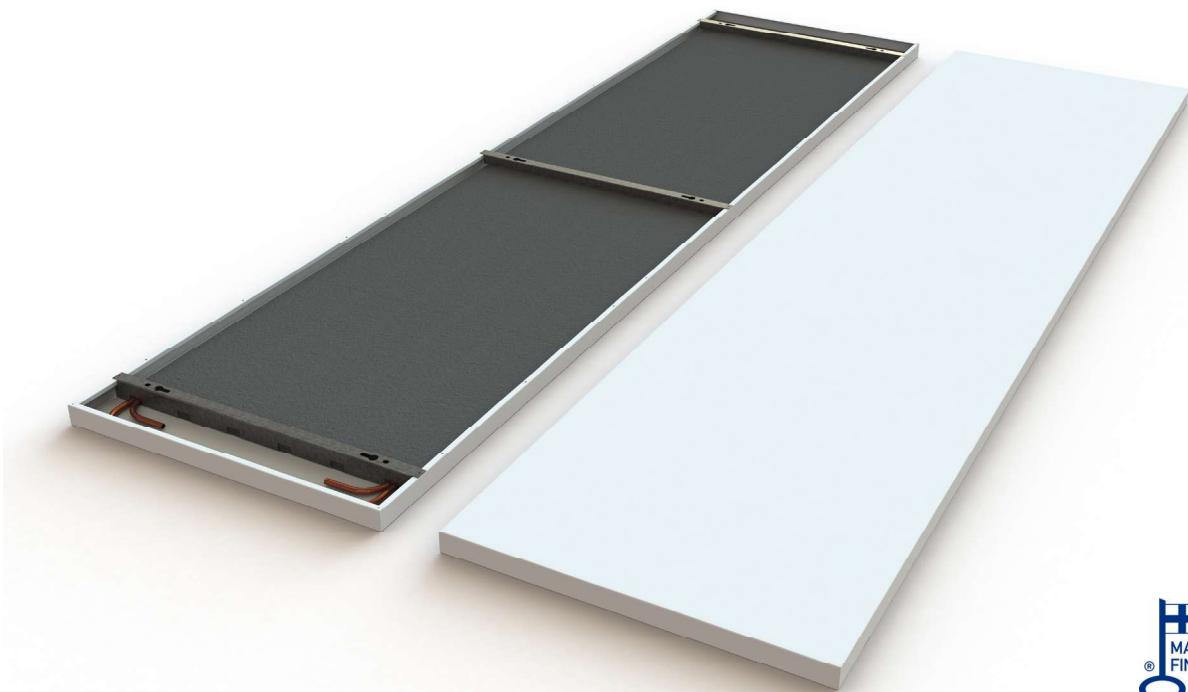

Optimized
1-circuit panel for heating
2-circuit panel for heating and cooling
Heating is with parallel connection

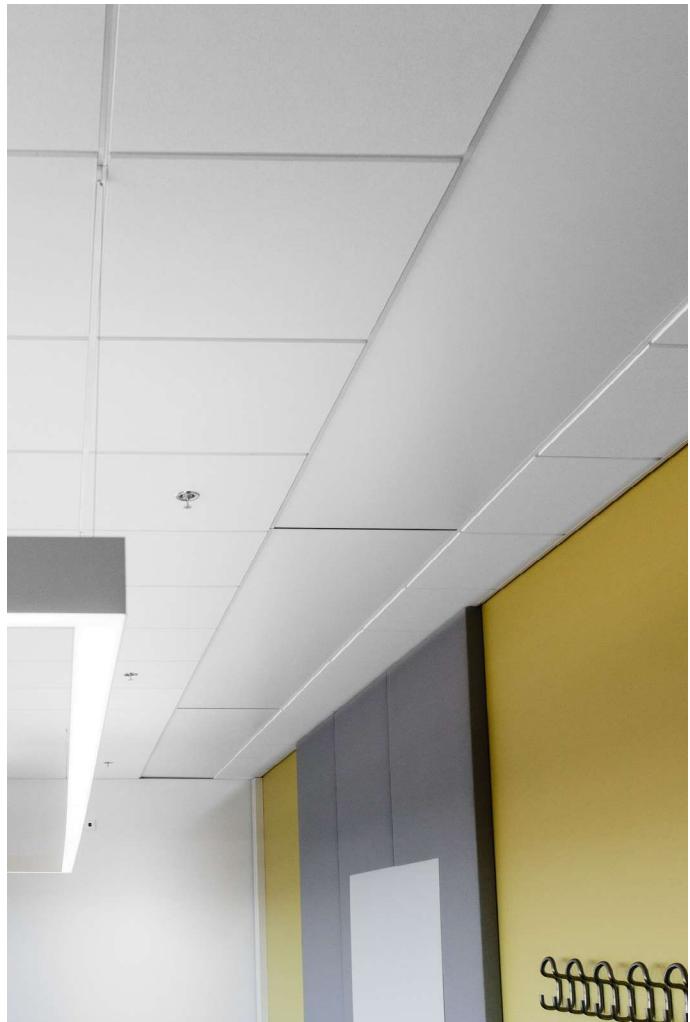

Optimized
1-circuit panel for heating
2-circuit panel for heating and cooling
Heating is with serial connection

ItuGraf Features and Benefits

- ◆ The most efficient radiant ceiling system on the market for heating and cooling. ItuGraf has the highest outputs and shortest system reaction times due to pipe fully embedded in graphite layer.
- ◆ Suitable to use with all energy sources in renovations and new buildings - ideally working in combination with heat pump systems! But can also be used for high temperature applications (*Smooth surface*)
- ◆ Maintain a pleasant, steady temperature across the whole space without generating draft, dust or noise and meets strict hygiene requirements - Best solution for hospitals and healthcare (*Smooth surface*)
- ◆ Panel does not draw attention on the building and interior design
- ◆ Maintenance-free and long service life
- ◆ Made of 100% recyclable materials
- ◆ Designed and Made in Finland by the highest quality standards

Tender Specification

ItuGraf® is a multifunctional panel system: heating, cooling and sound absorption in one system!

ItuGraf® -graphite panel has a 10 mm copper pipe meander embedded in a thermally conductive graphite layer. Panel's casing is formed from galvanized sheet steel 0.7 mm and is available with a smooth or a perforated surface. When the panel is perforated a nonwoven acoustic fabric is placed between the steel plate and the activation layer in order to get additional sound absorption effect. The air flow through has been structurally prevented in accordance with the EN 14037-1 standard. Panel can be painted in RAL colours (the standard colour is RAL 9016). Panels can also be fitted with insulation on the top surface in order to concentrate on the downward effect. ItuGraf standard insulation is made of glass wool with aluminium foil backing. Insulation material with thickness 20 mm is classified according to EN 14303, which thermal conductivity is λ (40°C) 0.040 W/(m·K) according to the standard EN 12667. Reaction to fire classification is A2 according to standard EN 13501-1.

The ItuGraf standard sail module in free hanging installation is the most efficient in spot heating and cooling cases. The standard panel with one copper meander can be used in combination with a change-over system using e.g. a 6-port valve to allow for heating or cooling. But Itula provides also panels in 2-circuit version, making it possible to connect the same panel to a four pipe net having so two totally independent cooling and heating networks working in parallel, without any risk of fluid mixing in the panel. The patented one layer graphite activation system makes sure that both circuits give the maximum possible output. The thermal transfer rate of ItuGraf panels is optimized to provide the maximum heating and/or cooling per unit:

ItuGraf® -graphite panel's cooling capacity (insulated) is 125 W/m² (160 W/m² non-insulated) per active area (at $\Delta T = 10$ K), which is in accordance with the EN 14240 standard. Cooling capacity is achieved with a turbulent flow in the panel's pipe meander, which leads in general to a temperature difference of 2-3 K on the water side.

ItuGraf® -graphite panel's heating output (insulated) is 182 W/m (305 W/m non-insulated) per active length of the panel (at $\Delta T = 30$ K), which is in accordance with the EN14037 standard. Heating output is achieved with a turbulent flow in the panel's pipe meander, which leads in general to a temperature difference of 5-10 K on the water side. The surface temperature of the perforated panel should not exceed 55°C.

The standard widths of the ItuGraf® panels are 595 mm, 895 mm and 1190 mm. The standard lengths are 590 mm, 1190 mm, 1790 mm, 2390 mm, 2990 mm and 3590 mm. Panels can also be made to measure upon request.

The panels can be hung from the ceiling by using adjustable cable wire mounting sets. The cassette can be adapted to the various existing suspended ceiling models such as Saint-Gobain Ecophon and Rockfon. The panels can also be easily installed directly on the ceiling using our patented surface bracket. The ItuGraf panels are CE marked and a Declaration of Performance is available upon request.

ItuGraf® panels can be connected in series of 2 to 5 pieces in serial or in parallel depending on the pressure losses of the selected product types and their combinations. The flows of individual or parallel-mounted panels can be standardized with adjustable inserts and flow control valves. The room temperature can be controlled by a thermostat located in the premises that changes the temperature or flow rate of the supply water using an actuator. Connections between panels can be realized using oxygen diffusion resistant flexible hoses with DN10 push-fit connectors on both ends. The connection to the main pipe can be realized using the same flexible hose type or another with ½" external thread on one end.
